RATIONAL DATA FOR ISOMORPHISM OF LIE ALGEBRAS

Bruce No Allison

1970

A Dissertation Presented to the Faculty of the Graduate School of Yale University in Candidacy for the Degree of Doctor of Philosophy.

Summary

Let $\mathcal L$ be a central simple Lie algebra over a field $\mathcal R$ of characteristic zero. Let $\mathcal J$ be a maximal split toral subalgebra of $\mathcal L$. Let $\overline{\mathcal L}$ be the set of non-zero restricted roots with respect to $\mathcal J$. Let

$$I = I. \oplus \sum_{8 \in \Xi} L_8$$

be the restricted root decomposition of \mathcal{L} with respect to \mathcal{I} , where \mathcal{L}_o is the centralizer of \mathcal{I} in \mathcal{L} . Suppose $[\mathcal{L}_o,\mathcal{L}_o] \neq (0)$. Let \mathcal{I} be a fundamental system for \mathcal{I} . In Chapter 4, we prove some results about the structure of the anisotropic kernel $[\mathcal{L}_o,\mathcal{L}_o]$ of $(\mathcal{L},\mathcal{I})$ for particular restricted root diagrams \mathcal{I} . These results may be obtained as consequences of the classification of admissible indices given in Tits [9]. The proofs given here however are independent of this classification. For $\mathcal{X} \in \mathcal{I}$, we regard $\mathcal{L}_{\mathcal{X}}$ as an \mathcal{L}_o module with respect to the adjoint action. In Chapter 5, we prove that with one specified exception $(\mathcal{L},\mathcal{I})$ is determined up to isomorphism by the diagram \mathcal{I} , the algebra \mathcal{L}_o , and the action of \mathcal{L}_o on $\mathcal{L}_{\mathcal{X}}$, where $\mathcal{X}_{\mathcal{I}}$ is a distinguished element of \mathcal{I} depending only on the diagram \mathcal{I} .

Acknowledgements

I wish to thank my advisor, Professor Seligman, for proposing the topic discussed herein and for several useful suggestions. This research was partially supported by the National Research Council of Canada.

Chapter 1

Introduction

In this chapter, we introduce some notation and recall some results about finite dimensional semi-simple Lie algebras over a field of characteristic zero. For the most part, proofs will be omitted. All of the results of this chapter are stated and proved in Seligman [7]. There are two main theorems in this chapter. Theorem 1, on the conjugacy of maximal split toral subalgebras, was presented in a seminar at Yale by T. Tamagawa and J. Humphreys and was attributed to G.D. Mostow. Theorem 2, the Witt type isomorphism theorem, is due independently to Tits [9] and Satake [5].

Let \mathcal{L} be a semi-simple Lie algebra over a field \mathcal{R} of characteristic zero. A toral subalgebra of \mathcal{L} is a commutative subalgebra \mathcal{K} of \mathcal{L} such that $\mathrm{ad}_{\mathcal{L}}(L)$ is semi-simple for all $L \in \mathcal{K}$. If \mathcal{L} is a subalgebra of \mathcal{L} , then \mathcal{L} is a Cartan subalgebra of \mathcal{L} if and only if \mathcal{L} is a maximal toral subalgebra of \mathcal{L} (see Prop.1 of Seligman [7] or Chapter VI, \mathcal{L} , Thm. 3 and Prop. 18 of Chevalley [2]). A toral subalgebra \mathcal{L} of \mathcal{L} is said to be split if $\mathrm{ad}_{\mathcal{L}}(L)$ has all its characteristic roots in \mathcal{L} for all $L \in \mathcal{L}$.

Let \mathcal{J} be a maximal split toral subalgebra of \mathcal{L} . Then, $\mathcal{L} = \bigoplus_{k=1}^{\infty} \mathcal{L}_k$, where \mathcal{X} runs over all linear functions \mathcal{X} on \mathcal{J} and $\mathcal{L}_k = \{L \in \mathcal{L} : [L,T] = \mathcal{X}(T)L\}$. The linear functions \mathcal{X} such that $\mathcal{L}_k \neq (0)$ are called <u>restricted roots relative to \mathcal{J} </u> (or roots of $(\mathcal{I},\mathcal{J})$). Let \mathcal{T} be the set of non-zero restricted roots relative to \mathcal{J} . Then,

 $\mathcal{L} = \mathcal{L} \oplus (\sum_{\mathbf{v} \in \Sigma} \mathcal{L}_{\mathbf{v}})$

and $\Im \subseteq \mathcal{L}$. (since \Im is commutative). Since $\operatorname{ad}_{\mathcal{L}}(\mathbb{T})$ is semisimple for all $\operatorname{T} \in \mathcal{I}$, $\operatorname{ad}_{\mathcal{L}}(\mathcal{I})$ is completely reducible and hence $\operatorname{ad}_{\mathcal{L}}(\mathcal{L}_o)$, the centralizer of $\operatorname{ad}_{\mathcal{L}}(\mathcal{I})$ in $\operatorname{ad}_{\mathcal{L}}(\mathcal{L})$, is completely reducible (see Thm. 3.10 and Thm. 3.18 of Jacobson [3]). Thus, $\mathcal{L}_o = \operatorname{center}(\mathcal{I}_o) \bigoplus [\mathcal{I}_o, \mathcal{I}_o]$, where $[\mathcal{I}_o, \mathcal{I}_o]$ is semi-simple and $\operatorname{ad}_{\mathcal{L}}(\mathcal{L})$ is semi-simple for all $\mathcal{L} \in \operatorname{center}(\mathcal{I}_o)$. $[\mathcal{I}_o, \mathcal{I}_o]$ is called the (semi-simple) anisotropic kernel of $(\mathcal{I}, \mathcal{I})$. If $\mathcal{I} = (0)$ (and hence $\mathcal{I} = [\mathcal{I}_o, \mathcal{I}_o]$), we say \mathcal{I} is anisotropic.

The Killing form of \mathcal{L} will be denoted by (,). Then, for $\mathcal{L} \subseteq \mathcal{L}_{\mathcal{L}}$ and $\mathcal{L}_{\mathcal{L}}$ are totally isotropic and dual to each other. The restriction of (,) to $\mathcal{L}_{\mathcal{L}}$ and to $\mathcal{L}_{\mathcal{L}}$ is non-degenerate. Thus, we obtain a corresponding form on the dual space $\mathcal{L}_{\mathcal{L}}^*$ in the usual way. Now, $\mathcal{L}_{\mathcal{L}}$ generates $\mathcal{L}_{\mathcal{L}}^*$ as a vector space over $\mathcal{L}_{\mathcal{L}}$ and we denote by $\mathcal{L}_{\mathcal{L}}$ the $\mathbb{C}_{\mathcal{L}}$ -space generated by $\mathcal{L}_{\mathcal{L}}$ in $\mathcal{L}_{\mathcal{L}}^*$. Then, (,) induces a positive definite symmetric form on the $\mathbb{C}_{\mathcal{L}}$ -space $\mathcal{L}_{\mathcal{L}}$. Moreover, we have that

- (I) $2\frac{(8,8)}{(8,8)}$ is an integer for $8,8\in\overline{2}$ and
- (II) $\aleph 2(8,8)$ $\delta \in \Sigma$ for $\aleph, \delta \in \Sigma$.

 i.e. Σ is a system of roots. If $\aleph \in \Sigma$, $\lambda \in \Omega$, and $\lambda \& \varepsilon \in \Sigma$, then $\lambda \in \{-2,-1,-\frac{1}{2},\frac{1}{2},1,2\}$. A fundamental system for Σ is a subset $\overline{\Pi}$ of Σ such that the elements of $\overline{\Pi}$ are linearly independent over Ω and, for $\aleph \in \Sigma$, we may write either \aleph or $-\aleph$ in the form $\Sigma = 0$, $\infty = 0$, $\infty = 0$.

where the m₈ are non-negative integers. The number of elements r in such a fundamental system Π is called the <u>rank</u> of \mathcal{I} (or the rank of Π) and we have $r = \dim_{\mathbb{A}} \mathcal{I}$. We say \mathbb{Z} is <u>reduced</u> (or \mathbb{I} is reduced) if $2 \times 4 \times \mathbb{Z}$ for $\times 6 \times \mathbb{Z}$. If \mathbb{Z} is connected and not reduced and \mathbb{I} is a fundamental system for \mathbb{Z} , then the Dynkin diagram for \mathbb{I} is \mathbb{I} is \mathbb{I} if \mathbb{I} if

where the square around the vertex %, indicates that 2%, $\in \Sigma$.

For $\emptyset \in \Sigma$, define $X_{\Sigma} = \mathbb{Z}$ by $\mathbb{E}^{\overline{W}_{\Sigma}} = \mathbb{E} - 2\frac{(\mathbb{E}, \mathbb{V})}{(\mathbb{V}, \mathbb{V})} \mathbb{V}$, $\mathbb{E} \in \mathbb{X}_{\Sigma}$. Then, for $\mathbb{V} \in \Sigma$, \overline{W}_{Σ} is in the orthogonal group of our form and $\mathbb{Z}^{\overline{W}_{\Sigma}} = \mathbb{Z}$. The group \overline{W} generated by $\{\overline{W}_{\Sigma}\}_{\Sigma \in \Sigma}$ is called the <u>restricted Weyl group</u> of (\mathbb{Z}, \mathbb{V}) and we have that \overline{W} is generated by $\{\overline{W}_{\Sigma}\}_{\Sigma \in \Sigma}$ for any fundamental system $\overline{\mathbb{T}}$.

Now, for $1, 5 \in \mathbb{Z} \cup \{0\}$, we have $[\mathcal{I}_{\chi}, \mathcal{I}_{5}] \in \mathcal{I}_{\chi+5}$. In particular, $[\mathcal{I}_{\chi}, \mathcal{I}_{6}] \in \mathcal{I}_{\chi}$ for $\chi \in \mathbb{Z}$. Thus, under the adjoint action, \mathcal{I}_{χ} is an \mathcal{I}_{δ} module for $\chi \in \mathbb{Z}$. But for $\chi \in \mathbb{Z}$ and $\chi \in \mathcal{I}_{\delta}$ we have $[\chi_{\chi}, \chi_{\delta}] = \chi_{\chi}$ (see lemma 7 of Seligman [7]). Thus, under the adjoint action, χ_{χ} is an irreducible χ_{δ} module for $\chi \in \mathbb{Z}$.

Suppose $X \in \overline{Z}$. Then, there exists a unique element T_{ξ} of J such that $T_{\xi} \in [J_{\xi}, J_{-\xi}]$ and $X(T_{\xi}) = 2$. Moreover, for $X_{\xi} \in \mathcal{L}_{\xi}$, there exists an element $X_{-\xi}$ of $J_{-\xi}$ such that $[X_{\xi}, X_{-\xi}] = T_{\xi}$. For these choices, the Lie algebra with f_{ξ} -basis $\{T_{\xi}, X_{\xi}, X_{-\xi}\}$ is the three dimensional split simple Lie algebra with multiplication table $[X_{\xi}, X_{-\xi}] = T_{\xi}$, $[X_{\xi}, T_{\xi}] = 2X_{\xi}$, and $[X_{-\xi}, T_{\xi}] = -2X_{-\xi}$. (See

{1.1 in Seligman [7] for this information.)

The origin of the following theorem was discussed at the beginning of this chapter. A proof is found in §1.3 of Seligman [7]. Theorem 1: Let \mathfrak{I}' be a second maximal split toral subalgebra of \mathfrak{I} . Then, there exists $\varphi \in \operatorname{Aut}(\mathcal{L})$ such that φ is a product of elements of $\{\exp(\operatorname{ad}_{\mathcal{L}}(N)\colon N\in \mathcal{L} \text{ , ad}_{\mathcal{L}}(N) \text{ nilpotent}\}$ and $\mathfrak{I}'=\mathfrak{I}^{\varphi}$.

Theorem 1 tells us, among other things, that in order to classify semi-simple algebras \mathbb{X} up to isomorphism it suffices to classify pairs (\mathbb{X},\mathbb{Y}) up to isomorphism. A second consequence of Theorem 1 is the known result that any two splitting Cartan subalgebras of a semi-simple Lie algebra are conjugate by an automorphism of the above form (see Steinberg [8]).

Let G be the group of all automorphisms φ of \mathcal{L} such that φ is a product of elements of $\{\exp(\operatorname{ad}_{\mathcal{L}}(N)) \colon N \in \mathcal{L}, \operatorname{ad}_{\mathcal{L}}(N) \text{ nilpotent}\}$ and $\mathcal{J}^{\varphi} = \mathcal{J}$. For $\varphi \in G$, we define $\varphi^* \in \mathcal{K}_{\Xi}$ by $\varphi^* = ((\varphi | \mathcal{J})^t)^{-1}$ (i.e. $\mathcal{E}^{\varphi^*}(T^{\varphi}) = \mathcal{E}(T)$ for $\mathcal{E} \in \mathcal{K}_{\Xi}$ and $T \in \mathcal{J}$). Then, for $\varphi \in G$, $\mathcal{L}^{\varphi^*} = \mathcal{L}_{X} =$

It follows from Theorem 1 that there exists a splitting Cartan subalgebra f of f if and only if f is a splitting Cartan subalgebra for f. The last of these statements is equivalent to f is f and so we say f is split if f is quasi-split. By the above remark and Theorem 1, it is clear that these two definitions are independent of our choice of f is f.

Now if Z is split, the classical theory tells us that (Z, J)

The main theorem of this work is an attempt to generalize this result to our more general situation. It is easy to see that Π does not in general determine $(\mathcal{I}, \mathcal{I})$ up to isomorphism (see §1.2 of Seligman [7]). The question which then arises is whether or not Π and \mathcal{I} , determine $(\mathcal{I}, \mathcal{I})$ up to isomorphism. I.e., suppose \mathcal{I}' is another semi-simple algebra over f with maximal split toral subalgebra \mathcal{I}' , and \mathcal{I}' are defined as above. Suppose that \mathcal{I}_{o} and \mathcal{I}_{o}' are isomorphic and Π and Π are isomorphic. Then, is it necessarily the case that $(\mathcal{I}, \mathcal{I})$ and $(\mathcal{I}', \mathcal{I}')$ are isomorphic? We now give an example which answers this question in the negative.

Let D be a finite dimensional central division algebra over R of degree d>1. Suppose J is an involution in D of first kind and suppose the anti-symmetric elements of D with respect to J have dimension $\frac{1}{2}d(d-1)$ over R. Let V be a 2r dimensional left vector space over D. We assume some D-basis for V is fixed. Let h be the non-degenerate hermitian form on V with matrix

$$\begin{pmatrix} 0 & I_r \\ I_r & 0 \end{pmatrix} .$$

Let $\mathcal X$ be the set of D-linear transformations of V which are skew with respect to the form h. Then, $\mathcal X$ is a central simple Lie algebra over $\mathcal H$. The elements of $\mathcal X$ are matrices of the form

$$\begin{pmatrix} A_{ii} & A_{i2} \\ A_{2i} - A_{ii}^{Jt} \end{pmatrix},$$

where A_{ii} , A_{i2} , and A_{2i} are rxr matrices with coefficients in D,

 $A_{12}^{Jt} = -A_{13}$, and $A_{21}^{Jt} = -A_{21}$. Let \mathcal{J} be the subalgebra of \mathcal{J} consisting of elements of \mathcal{J} which are diagonal with entries in \mathcal{J}_i . Then, \mathcal{J}_i is a maximal split toral subalgebra of \mathcal{J}_i . Let $e_{i,j}$, $1 \le i,j \le 2r$, be the matrix units. Define $\lambda_i: \mathcal{J} \longrightarrow \mathcal{J}_i$ by $\lambda_i (\sum_{j=1}^r a_j (e_{j,j} - e_{r+j,r+j})) = a_i$, $i=1,\ldots,r$ (where the a_j are in f_i). Then, the restricted roots of \mathcal{J}_i are $f_i(\lambda_i + \lambda_j)$, $1 \le i < j \le r$ and $f_i(\lambda_i + \lambda_j)$, $1 \le i < r$. A fundamental system $f_i(\lambda_i + \lambda_j)$ for these roots is $f_i(\lambda_i + \lambda_j)$, $f_i($

The centralizer \mathcal{L}_{o} of \mathcal{J} in \mathcal{L} consists of the elements of \mathcal{L} which are diagonal with entries in D. Hence, \mathcal{L}_{o} as a Lie algebra is isomorphic to r copies of D. Now, if y is a non-zero antisymmetric element of D with respect to J, then the map $x \xrightarrow{K} y'x^{J}y$ is an involution of the first kind such that the anti-symmetric elements of D with respect to K have dimension $\frac{1}{2}d(d+1)$ over $\frac{1}{4}$. Moreover, the above discussion holds word for word with J replaced by K. Thus, we obtain two different algebras (one using J and the other using K) with the same $\overline{\mathbb{T}}$ and \mathcal{J}_{\bullet} . However, it is well known (see for example \$10.6 of Jacobson [3]) that the two algebras are not isomorphic, since the anti-symmetric elements with respect to J and K do not have the same dimension over k. We note before leaving this example that, whether we are dealing with J or K, the restricted root space $\mathcal{L}_{a \lambda_a}$ corresponding to the long root in the diagram $\overline{\Pi}$ is D e, , where D is the space of anti-symmetric elements with respect to the involution. Hence, the Zo module

is different in the two cases i.e. the two \mathcal{L}_{\bullet} modules in question are not isomorphic (indeed they have different dimensions over k_{\bullet}).

The above example motivates the isomorphism theorem of Chapter 5 which states (roughly) that if \mathcal{X} is central simple, then $(\mathcal{X}, \mathcal{I})$ is determined up to isomorphism by \mathcal{I}_o , $\overline{\Pi}$, and the action of \mathcal{I}_o on $\mathcal{I}_{\overline{\Pi}}$, where $\overline{\Pi}$ is a distinguished element of $\overline{\Pi}$ depending only on the root system $\overline{\Sigma}$. This isomorphism theorem is rational in the sense that it can be stated without reference to a splitting extension for \mathcal{I} . Its proof is based upon applications of Theorem 2 of this chapter. Theorem 2 is also an isomorphism theorem but it is non-rational (in the above sense). In order to state Theorem 2, we must introduce some "splitting data" for \mathcal{I} , and in particular, we must introduce the index of \mathcal{I} .

We may choose a Cartan subalgebra f of f such that $f \in f$. We may also choose a finite dimensional Galois extension K/f_0 such that K/f_0 splits the adjoint action of f on f. Let f = Gal(K/f_0).

Let Σ be the set of non-zero roots of $(\mathcal{L}_{K}, \mathcal{J}_{K})$. Now, $(\mathcal{L}_{K})_{K} = \sum_{\mathbf{z} \in \Sigma, \mathbf{z} \in \Sigma, \mathbf{z} \in \Sigma} (\mathcal{L}_{K})_{\mathbf{z}} \quad \text{for } \emptyset \in \overline{\Sigma} \text{, and } (\mathcal{L}_{G})_{K} = \mathcal{J}_{K} + \sum_{\mathbf{z} \in \Sigma, \mathbf{z} \in \Sigma, \mathbf{z} \in \Sigma} (\mathcal{L}_{K})_{\mathbf{z}}.$

Thus, \sum is the set of non-zero restrictions of elements of \sum to \Im_{K} .

We may regard (,) as a form on \mathcal{L}_{K^*} (,) is non-degenerate when restricted to f_{K^*} . As usual, we may transfer (,) to a form (,) on the dual space f_{K^*} of f_{K^*} . We regard f_{K^*} as a K-subspace of f_{K^*} by identifying f_{K^*} with the element of f_{K^*} which is equal to f_{K^*} on f_{K^*} and zero on the orthogonal complement of f_{K^*} in f_{K^*} . The restriction of (,) to f_{K^*} is exactly the form

(,) defined on \mathfrak{I}^* previously (and extended to \mathfrak{I}_K^*).

Now, \sum generates \int_K^* as a vector space over K. Let \times_{\sum} be the Q-vector space generated by \sum in \int_K^* . Then, (,) induces a positive definite symmetric form on the Q-space \times_{\sum} . For $\alpha \in \sum$, we will use the notation $\widehat{\alpha} = 2\frac{\alpha}{(\alpha, \alpha)}$.

Now, L acts on L_K fixing the elements of L. This action fixes the elements of L and hence stabilizes L_K . Thus, we obtain an action of L on L_K as follows: L (L (L) = L (L), L = L (L), L = L for L = L , and we have an action of L on L . Thus, L = L for L , and we have an action of L on L .

Write $f_K = \mathcal{I}_K \oplus \mathcal{O}_K$, where \mathcal{O} is the orthogonal complement of \mathcal{I} in f. We have $\mathcal{X}_Z = \mathcal{X}_S \oplus \mathcal{X}_s$, where $\mathcal{X}_A = \{ \mathcal{E} \in \mathcal{X}_s : \mathcal{E}^s = \mathcal{E} \text{ for all } \sigma \in \mathcal{S}_s \}$ and

We have $(\mathcal{E}_{i}, \mathcal{E}_{a})^{\sigma} = (\mathcal{E}_{i}^{\sigma}, \mathcal{E}_{s}^{\sigma})$ for $\mathcal{E}_{i}, \mathcal{E}_{s} \in \mathcal{J}_{K}^{*}$ and $\sigma \in \mathcal{J}$.

Therefore, $(\mathcal{E}_{i}^{\sigma}, \mathcal{E}_{a}^{\sigma}) = (\mathcal{E}_{i}, \mathcal{E}_{s})$ for $\mathcal{E}_{i}, \mathcal{E}_{s} \in \mathcal{X}_{Z}$ and $\sigma \in \mathcal{J}$.

Thus, \mathcal{X}_{d} and \mathcal{X}_{o} are orthogonal. Indeed using the fact that \mathcal{I} is a maximal split toral subalgebra of \mathcal{I} , we have that

 $\chi_{\underline{A}} = \{ \varepsilon \in \chi_{\underline{X}} : \varepsilon(\underline{H}) = 0 \text{ for all } \underline{H} \varepsilon \sigma_{\underline{K}} \} \text{ and } \chi_{\underline{A}} = \{ \varepsilon \in \chi_{\underline{X}} : \varepsilon(\underline{H}) = 0 \text{ for all } \underline{H} \varepsilon \sigma_{\underline{K}} \}.$

For $\mathcal{E}_{\mathcal{Z}}$, define $\mathcal{E} = \frac{1}{|\mathcal{L}|} \sum_{\sigma \in \mathcal{L}} \mathcal{E}^{\sigma}$. Then, $\mathcal{E} \longrightarrow \mathcal{E}$ is the projection of $\mathcal{X}_{\mathcal{Z}}$ onto the first factor in $\mathcal{X}_{\mathcal{L}} \oplus \mathcal{X}_{\sigma}$. By the above remarks it follows that for $\mathcal{E} \in \mathcal{X}_{\mathcal{Z}}$,

$$\overline{\mathcal{E}}$$
(H) =
$$\begin{cases} \mathcal{E}(H) & \text{if } H \in \mathcal{I}_K \\ 0 & \text{if } H \in \mathcal{I}_K \end{cases}$$

i.e. $\overline{\mathcal{E}}$ is the restriction of \mathcal{E} to \mathcal{I}_K (regarded as an element of \mathcal{J}_K^* by our previous identification). Thus, for $\mathcal{E} \in \mathcal{H}_Z$, the restriction of \mathcal{E} to \mathcal{I}_K is an element of \mathcal{H}_Z . But $\overline{\mathcal{E}}$ is the set of non-zero restrictions of elements of $\overline{\mathcal{E}}$ to \mathcal{I}_K^* . ($\overline{\mathcal{E}}$ here is the set of restricted roots and not the image of $\overline{\mathcal{E}}$ under the bar mapping.) Thus, $\overline{\mathcal{E}} \in \mathcal{H}_Z$. Indeed, $\overline{\mathcal{E}} \in \mathcal{H}_Z$ and, from the dimensions of \mathcal{H}_Z and \mathcal{H}_Z , it follows that $\mathcal{H}_Z = \mathcal{H}_Z$.

Let $\sum_{o} = \sum_{c} \bigwedge_{o} i.e.$ \sum_{c} is the set of non-zero roots of $(\mathcal{L}_{K}, \mathcal{J}_{K})$ which are zero on \mathcal{J}_{K} . Thus, \sum_{c} is the set of non-zero roots of $(\mathcal{L}_{K}, \mathcal{J}_{K})$ whose root vectors are elements of $(\mathcal{J}_{o})_{K}$. But $\mathcal{J}_{o} = \operatorname{center}(\mathcal{J}_{c}) \oplus [\mathcal{J}_{c}, \mathcal{J}_{c}]$ and $\operatorname{center}(\mathcal{J}_{c}) \subseteq \mathcal{J}_{c}$. Thus, $\sum_{c} (\operatorname{can} \operatorname{be} \operatorname{identified} \operatorname{with} \operatorname{the} \operatorname{set} \operatorname{of} \operatorname{non-zero} \operatorname{roots} \operatorname{of} ((\mathcal{J}_{o}, \mathcal{J}_{c})_{K}, (\mathcal{J}_{o} \cap [\mathcal{J}_{o}, \mathcal{J}_{c}])_{K})$.

We may regard $(f_{C} \cap [\mathcal{L}_{o}, \mathcal{L}_{o}])_{K}^{*}$ as a subspace of f_{K}^{*} by identifying $\mathcal{E} \in (f_{C} \cap [\mathcal{L}_{o}, \mathcal{L}_{o}])_{K}^{*}$ with the element of f_{K}^{*} which is equal to \mathcal{E} on $(f_{C} \cap [\mathcal{L}_{o}, \mathcal{L}_{o}])_{K}$ and is zero on the orthogonal complement of $(f_{C} \cap [\mathcal{L}_{o}, \mathcal{L}_{o}])_{K}$ in f_{K} . Let \mathcal{X}_{Σ} be the \mathbb{Q} -space generated by f_{Σ} in $(f_{C} \cap [\mathcal{L}_{o}, \mathcal{L}_{o}])_{K}^{*}$ (or equivalently in f_{K}^{*}). Then, $\mathcal{X}_{\Sigma} \subseteq \mathcal{X}_{o}$.

A fundamental system \prod for \sum is said to be <u>admissible</u> if the following condition holds:

 $\alpha \in \sum -\sum_{\sigma} \alpha \geqslant 0 \implies \alpha^{\sigma} \geqslant 0$ for all $\sigma \in \mathcal{L}$, where $\alpha \geqslant 0$ indicates that α is a positive root with respect to

the fundamental system Π . If Π is an admissible fundamental system, then $\Pi_o = \Pi \cap X_o$ is a fundamental system for Σ_o and the set Π of non-zero restrictions of Π to Ω_K is a fundamental system for Σ . Conversely, suppose Π_o is a fundamental system for Σ_o and let Π be a fundamental system for Σ . Then,

P = $\left\{ \alpha \in \mathbb{Z} - \Sigma_o : \mathbb{Z} \geq 0 \right\} \cup \left\{ \alpha \in \Sigma_o : \alpha \geq 0 \right\}$ is a positive system for Σ i.e. $\Sigma = P \cup (-P)$ and $P \cap (-P) = \phi$. The fundamental system \prod for Σ corresponding to Γ is admissible. The two processes described here are inverse to one another and we have a 1-1 correspondence between admissible fundamental systems \prod for Σ and pairs (\prod, \prod_o) , where \prod is a fundamental system for Σ and \prod_o is a fundamental system for Σ_o .

Let \mathbb{X} be the Weyl group of (X_K, f_K) acting in \mathbb{X}_{Σ} . Let \mathbb{X}_{δ} be the subgroup of \mathbb{X} stabilizing \mathbb{X}_{δ} . Let \mathbb{X}_{δ} be the subgroup of \mathbb{X} generated by the reflections $\{w_{\delta}\}_{\delta \in \Sigma_{\delta}}$. Then, \mathbb{X}_{δ} stabilizes $\mathbb{X}_{\delta} = \mathbb{X}_{\delta} = \mathbb{X}_{\delta} = \mathbb{X}_{\delta}$ and hence \mathbb{X}_{δ} is a normal subgroup of \mathbb{X}_{δ} . Now, $\mathbb{X}_{\delta} = \mathbb{X}_{\delta} = \mathbb{$

We now choose an admissible fundamental system Π for Σ . Let $\Pi_o = \Pi \cap \mathcal{X}_e$ and let $\overline{\Pi}$ be the set of non-zero restrictions of Π to Π . Π , Π , and $\overline{\Pi}$ will remain fixed throughout the remainder of this chapter.

Now, for $\sigma \in \mathcal{S}$, Π^{\bullet} is a fundamental system for Σ . Thus, for $\sigma \in \mathcal{A}$, there exists a unique $\mathbf{w}_{\epsilon} \in \mathcal{W}$ such that $\Pi^{\sigma \mathbf{w}_{\epsilon}} = \Pi$. We have, in fact, that $\mathbf{w}_{\epsilon} \in \mathcal{W}_{\bullet}$ for $\sigma \in \mathcal{A}$. Thus, for $\sigma \in \mathcal{A}$, we may define σ^{*} in the orthogonal group of the form (,) on \mathcal{W}_{Σ} by $\mathcal{E}^{\sigma^{*}} = \mathcal{E}^{\sigma \mathbf{w}_{\bullet}}$, $\mathcal{E} \in \mathcal{W}_{\Sigma}$. We have then that $\Pi^{\sigma^{*}} = \Pi$ and $\Pi^{\sigma^{*}} = \Pi_{\epsilon}$ for $\sigma \in \mathcal{A}$. We have also that $(\sigma \circ \mathcal{E})^{*} = \sigma^{*} \circ \mathcal{E}^{*}$ for σ , σ and σ is called the *-action of \mathcal{A} . The triple $(\Pi, \Pi_{\bullet}, *)$ is called the index of \mathcal{A} . For simplicity, we usually refer to the pair (Π, Π_{\bullet}) as the index of \mathcal{A} (omitting reference to the *-action). If \mathcal{A} is anisotropic, we have $\Pi = \Pi_{\bullet}$ and in this case we simply refer to Π as the index of \mathcal{A} . An orbit in Π of the *-action of \mathcal{B} is called a *-orbit.

The index of \mathcal{L} is independent of our choice of \mathcal{I} , \mathcal{L} , and \mathcal{T} . Indeed, if \mathcal{I}' , \mathcal{L}' , and \mathcal{T}' are another choice and \mathcal{T}_{σ}' is defined as above, then there exists an isomorphism $(\mathcal{T}, \mathcal{T}_{\sigma}) \longrightarrow (\mathcal{T}', \mathcal{T}_{\sigma}')$ of diagrams which preserves the *-action.

Let $\mathcal{X} \in \overline{\Pi}$. Put $\mathcal{O}_{\mathcal{X}} = \{ \alpha \in \Pi : \overline{\alpha} = \mathcal{X} \}$. Then, $\mathcal{O}_{\mathcal{X}}^{**} = \mathcal{O}_{\mathcal{X}}^{*}$ for $\alpha \in \mathcal{A}$. Suppose $\alpha \in \mathcal{Z}$ such that $\overline{\alpha} = \mathcal{X}$. Then, we may write $\alpha = \alpha_1 + \sum_{\beta \in \Pi_{\alpha}} m_{\beta} \beta$ for some $\alpha_1 \in \mathcal{O}_{\mathcal{X}}^{*}$ and non-negative integers m_{β} . Moreover, if $\alpha \in \mathcal{A}$, then $\alpha = \mathcal{X}$ and the element of $\mathcal{O}_{\mathcal{X}}^{*}$ appearing in a similar sum for $\alpha = 1$ is α_1^{**} .

Let $\emptyset \in \Pi$. We show that \overline{U}_{δ} is a *-orbit of Π . Suppose \overline{U}_{δ} and \overline{U}_{δ} are two disjoint non-empty *-orbits of Π contained in \overline{U}_{δ} . Let $V_{i} = \sum_{i} (\mathcal{L}_{K})_{\infty}$, where the sum runs over all $\alpha \in \sum$ such that $\alpha = \emptyset$ and the element of \overline{U}_{δ} appearing in the above sum for $\alpha \in \mathbb{R}$ is a non-zero $(\mathcal{L}_{\delta})_{K}$ submodule of $(\mathcal{L}_{\delta})_{K}$ such that $V_{i} = V_{i}$ for $\alpha \in \mathcal{L}_{\delta}$, i=1,2. Moreover, $V_{i} \cap V_{\alpha} = (0)$. This contradicts the irreducibility of \mathcal{L}_{δ} as an \mathcal{L}_{δ} module. Thus, \mathcal{L}_{δ} is a *-orbit of Π .

Following Tits [9], we may introduce the following diagrammatic representation of the index of \mathcal{L} : The Dynkin diagram of \mathbb{T} is drawn in such a way that elements in the same *-orbit are close together. The *-orbits \mathcal{O}_{δ} , $\delta \in \mathbb{T}$, are circled and are referred to as <u>distinguished orbits</u>. For example, we have the following index in which the *-action is trivial and there are r distinguished orbits:

d-l vertices d-l vertices d-l vertices

(Consider for example the diagram or the non-connected diagram.) Thus, when we represent an index by a diagram as above, we say only that the index is of the form .)

Suppose for the remainder of this chapter, that \mathcal{L}' is another semi-simple Lie algebra over \mathcal{H} . Suppose \mathcal{J}' is a maximal split toral subalgebra for \mathcal{L}' and suppose \mathcal{L}' is a Cartan subalgebra for such that $\mathcal{J}' \subseteq \mathcal{L}'$. We assume that the extension $\mathcal{K}'\mathcal{H}$ is also a splitting extension for the adjoint action of \mathcal{L}' on \mathcal{L}' . Define $\overline{\mathcal{L}}'$, $\mathcal{X}'_{\overline{\mathcal{L}}'}$, $\mathcal{X}'_{\overline{\mathcal{L}}'}$, $\mathcal{X}'_{\overline{\mathcal{L}}'}$, $\mathcal{X}'_{\overline{\mathcal{L}}'}$, $\mathcal{X}'_{\overline{\mathcal{L}}'}$, and $\mathcal{X}'_{\overline{\mathcal{L}}'}$ as above. Let $\overline{\mathcal{L}}'$ be an admissible fundamental system for $\overline{\mathcal{L}}'$. Define $\overline{\mathcal{L}}'$ and $\overline{\mathcal{L}}'_{\overline{\mathcal{L}}'}$ as above.

A *-isomorphism $(\Pi, \Pi_o) \xrightarrow{f} (\Pi', \Pi'_o)$ is an isomorphism $\Pi \xrightarrow{f} \Pi'$ of Dynkin diagrams such that $\Pi_o^f = \Pi'_o$ and f preserves the *-action of L.

Suppose that we have an isomorphism $(\mathcal{L}, f) \xrightarrow{\varphi} (\mathcal{L}', f')$.

Then, $\mathcal{J}^{\varphi} = \mathcal{J}'$. Define $(f_K)^* \xrightarrow{\varphi^*} (f_K)^*$ by $\mathcal{E}^{\varphi^*}(H^{\varphi}) = \mathcal{E}(H)$ for $\mathcal{E} \in (f_K)^*$ and $H \in f_K$ i.e. $\varphi^* = ((\varphi | f_K)^t)^t)'$. Then, $\mathcal{L}^{\varphi^*} = \mathcal{L}'$ and $\mathcal{L}_{\varphi^*} \xrightarrow{\varphi^*} \mathcal{L}'$ is called the map $\mathcal{L}_{\varphi^*} \xrightarrow{\varphi^*} \mathcal{L}'$ induced by φ . If $f_{\varphi^*} = \mathcal{L}'$ is a fundamental system for \mathcal{L}' and hence there exists $w \in \mathcal{M}'$ (the Weyl group of \mathcal{L}') such that $\mathcal{L}_{\varphi^*} = \mathcal{L}'$. Put $f_{\varphi^*} = (\varphi^* w') | \mathcal{L}_{\varphi^*} = \mathcal{L}'$. Then, $\mathcal{L}_{\varphi^*} = \mathcal{L}'$, and $f_{\varphi^*} = \mathcal{L}'$ induced by $f_{\varphi^*} = \mathcal{L}'$ induced by $f_{\varphi^*} = \mathcal{L}'$. We note that if $f_{\varphi^*} = \mathcal{L}'$, then the *-isomorphism $(\mathcal{L}, \mathcal{L}_{\varphi^*}) = \mathcal{L}'$ induced by $f_{\varphi^*} = \mathcal{L}'$

If we have an isomorphism

We are now ready to state the Witt type isomorphism theorem. It is due independently to Tits [9] and Satake [5]. A proof is found in {2.2 of Seligman [7].

Theorem 2: Suppose \mathcal{L} , \mathcal{I} , \mathcal{J} , \mathcal{J} , \mathcal{J}' , \mathcal{J}' , and \mathcal{I}' are as above and all other notation is as above. Suppose we have an isomorphism

 $([\mathcal{L}_o,\mathcal{L}_o],f_\cap[\mathcal{L}_o,\mathcal{L}_o]) \xrightarrow{\varphi_\bullet} ([\mathcal{L}_o',\mathcal{L}_o'],f_\cap[\mathcal{L}_o',\mathcal{L}_o']),$ Let $\Pi_o \xrightarrow{f_o} \Pi_o'$ be the *-isomorphism induced by φ_o . Suppose we have a *-isomorphism $(\Pi,\Pi_o) \xrightarrow{f} (\Pi',\Pi_o')$. Suppose there exists $w, \in \mathcal{V}$, such that $\Pi_o^{w_o} = \Pi_o$ and $f \colon \Pi_o = (w,\Pi_o) \cdot f_o$. Then, there exists an isomorphism $(\mathcal{L},f_o,\mathcal{I}) \xrightarrow{\varphi_o} (\mathcal{L}',f_o',\mathcal{I}')$ such that $\varphi \colon [\mathcal{L}_o,\mathcal{L}_o] = \varphi_o$ and the *-isomorphism $(\Pi,\Pi_o) \xrightarrow{\varphi_o} (\Pi',\Pi_o')$ induced by φ is f.

Chapter 2

Some Generalities About Indices

In this chapter, we introduce some general notions which will enable us to study the relationship between the restricted diagram and the index of an algebra. We will assume throughout the chapter that \mathcal{L} is a semi-simple algebra over k and that \mathcal{I} , k, k, \mathcal{I} , \mathcal{I} , etc. are as in Chapter 1.

We are interested in the way in which the index (Π, Π_o) of \mathcal{I} depends on the restricted diagram $\overline{\Pi}$. Borel and Tits [1, Thm. 6.13] have dealt with the converse question and have shown that the diagram $\overline{\Pi}$ is uniquely determined by the index (Π, Π_o) . Their method of verifying this fact suggests the importance of certain subalgebras of \mathcal{I} of (restricted) rank 1 (together with their indices). Satake's discussion (see Chapter II, $\int 3.1$ of Satake [6]) of the classification of admissible diagrams (i.e. diagrams which arise as indices of semi-simple algebras) also suggests the consideration of these same rank 1 subalgebras.

We are led then to define subalgebras \mathcal{O}_{i} of \mathcal{Z} for $\mathcal{X} \in \Sigma$ as follows: Suppose $\mathcal{X} \in \Sigma$. Define

$$O_{\lambda} = [J_{\lambda}, J_{-\lambda}] \oplus \sum_{\substack{m \in \mathbb{Z} \\ m \neq 0}} J_{m\lambda}.$$

Now, if $2 \% \in \Sigma$, it is easily seen (see lemma 7 of Seligman [7]) that $\mathcal{L}_{3\%} = [\mathcal{L}_{\%}, \mathcal{L}_{\%}]$ and hence $[\mathcal{L}_{3\%}, \mathcal{L}_{-3\%}] \subseteq [\mathcal{L}_{\%}, \mathcal{L}_{\%}]$. Thus, $\mathcal{O}_{\%}$ is a subalgebra of \mathcal{L} . Now, $[\mathcal{L}_{\%}, \mathcal{L}_{-\%}]$ is an ideal of \mathcal{L}_{o} and hence,

since \mathcal{L} , is reductive, we have

$$[\mathcal{L}_{y}, \mathcal{L}_{-y}] = \operatorname{center}([\mathcal{L}_{y}, \mathcal{L}_{-y}]) \oplus [[\mathcal{L}_{y}, \mathcal{L}_{-y}], [\mathcal{L}_{y}, \mathcal{L}_{-y}]],$$

$$\operatorname{center}([\mathcal{L}_{y}, \mathcal{L}_{-y}]) = [\mathcal{L}_{y}, \mathcal{L}_{-y}] \cap \operatorname{center}(\mathcal{L}_{0}),$$

and

$$[[L_x, L_y], [L_y, L_y]] = [L_y, L_y] \cap [L_y, L_y].$$

We define

$$J_{x,x} = [[J_x, J_{-x}], [J_x, J_{-x}]] = [J_x, J_y] \cap [J_x, J_x].$$

We then have:

Prop. 1: Let $\forall \in \Sigma$. Then, $\mathcal{O}_{\mathcal{S}}$ is a simple subalgebra of \mathcal{L} with maximal split toral subalgebra $\notin T_{\mathcal{S}}$, where $T_{\mathcal{S}} \in \mathcal{I}$ is defined as in Chapter 1. The centralizer of $\notin T_{\mathcal{S}}$ in $\mathcal{O}_{\mathcal{S}}$ is $[\mathcal{L}_{\mathcal{S}}, \mathcal{L}_{-\mathcal{S}}]$ and the anisotropic kernel of $\mathcal{O}_{\mathcal{S}}$ (with respect to $\notin T_{\mathcal{S}}$) is $\mathcal{L}_{-\mathcal{S}}$. $\mathcal{L}_{\mathcal{S}} \cap [\mathcal{L}_{\mathcal{S}}, \mathcal{L}_{-\mathcal{S}}]$ is a Cartan subalgebra of $\mathcal{O}_{\mathcal{S}}$ containing $\mathcal{L}_{\mathcal{S}}$.

Proof: We show that O_{J_X} is simple. The rest of the proposition is clear. Let J_X be a proper ideal of O_{J_X} . Since T_X normalizes J_X , we have $J_X = J_X \cap J$

representation theory for L_{Σ} applied to the L_{Σ} module L_{Σ} that $[L_{\Sigma}\cap L_{\Sigma}, X_{\Sigma}] = L_{\Sigma}\cap L_{\Xi\Sigma}$. Therefore, $L_{\Sigma}\cap L_{\Xi\Sigma} = (0)$. Similarly, $L_{\Sigma}\cap L_{\Sigma} = (0)$ and $L_{\Sigma}\cap L_{\Sigma\Sigma} = (0)$. Thus, $L_{\Sigma}\cap L_{\Sigma} = (0)$. But then $[L_{\Sigma}, L_{\Sigma}] = L_{\Sigma}\cap L_{\Sigma} = (0)$ and hence $[L_{\Sigma}, L_{\Sigma}] = (0)$. Similarly, $[L_{\Sigma}, L_{\Sigma}] = (0)$. Thus, $[[L_{\Sigma}, L_{\Sigma}], L_{\Sigma}] = (0)$ and hence $L_{\Sigma}\cap L_{\Sigma}\cap L_{$

For $\delta \in \sum$, define

 $\mathcal{O}_{\mathcal{X}} = \left\{ x_{o} \in \mathcal{L}_{o} : [\mathcal{L}_{\mathcal{X}}, x_{o}] = (0) \right\}.$

I.e. \mathcal{O}_{χ} is the annihilator in \mathcal{L}_{o} of the \mathcal{L}_{o} module \mathcal{L}_{χ} (under the adjoint action).

Prop. 2: Let $\chi \in \Sigma$. Then, \mathcal{O}_{χ} is orthogonal to $[\mathcal{L}_{\chi}, \mathcal{L}_{\chi}]$ with respect to the Killing form,

 $\mathcal{L}_{o} = \mathcal{O}_{g} \oplus [\mathcal{L}_{g}, \mathcal{L}_{-g}],$

 $\mathcal{O}_{-y} = \mathcal{O}_{y}$, and \mathcal{O}_{y} centralizes \mathcal{O}_{y} .

<u>Proof:</u> We first show that $\mathcal{O}_{\chi} = [\mathcal{L}_{\chi}, \mathcal{L}_{-\chi}]^{\perp}$, where $[\mathcal{L}_{\chi}, \mathcal{L}_{-\chi}]^{\perp}$ denotes the k-vector space of elements of \mathcal{L}_{ζ} orthogonal to $[\mathcal{L}_{\chi}, \mathcal{L}_{-\chi}]$.

Let $X_{\bullet} \in \mathcal{O}_{X}$. Then, for $X_{X} \in \mathcal{L}_{X}$ and $X_{-Y} \in \mathcal{L}_{-X}$,

 $(X_{o},[X_{g},X_{-g}]) = ([X_{o},X_{g}],X_{-g}) = (0,X_{-g}) = 0.$ Therefore,

 $X_o \in [\mathcal{L}_X, \mathcal{L}_{-X}]^{\perp}$. Conversely, suppose $X_o \in [\mathcal{L}_X, \mathcal{L}_{-X}]^{\perp}$. Let $X_X \in \mathcal{L}_X$. Then, for $X_{-X} \in \mathcal{L}_{-X}$, $([X_o, X_Y], X_{-X}] = (X_o, [X_X, X_{-X}]) = 0$. Therefore, $[X_o, X_X]$ is orthogonal to \mathcal{L}_{-X} . But $[X_o, X_X] \in \mathcal{L}_X$ and hence $[X_o, X_X]$ is orthogonal to \mathcal{L} . Therefore, $[X_o, X_X] = 0$. Thus, $X_o \in \mathcal{OI}_X$.

Since $O_y = [L_y, L_{-y}]^{\perp}$, $O_{l_y} = O_{-y}$.

It remains to show that \mathcal{O}_{χ} centralizes \mathcal{O}_{χ} . By definition, \mathcal{O}_{χ} centralizes \mathcal{L}_{χ} . By (1), \mathcal{O}_{χ} centralizes $[\mathcal{L}_{\chi},\mathcal{L}_{-\chi}]$. Since $\mathcal{O}_{\chi} = \mathcal{O}_{-\chi}$, \mathcal{O}_{χ} centralizes $\mathcal{L}_{-\chi}$. But as we have remarked previously, $\mathcal{L}_{-\chi} = [\mathcal{L}_{\chi},\mathcal{L}_{\chi}]$ and hence \mathcal{O}_{χ} centralizes $\mathcal{L}_{-\chi}$. Similarly, \mathcal{O}_{χ} centralizes $\mathcal{L}_{-\chi}$. Therefore, \mathcal{O}_{χ} centralizes \mathcal{O}_{χ} . q.e.d.

Corollary: Let $\chi \in \Sigma$. Let $\mathcal{L}_{o,i}$ be a simple summand of $[\mathcal{L}_{o,i},\mathcal{L}_{o}]$. Then, $\mathcal{L}_{o,i}$ acts non-trivially on \mathcal{L}_{g} if and only if $\mathcal{L}_{o,i} \subseteq \mathcal{L}_{o,g}$.

We will be interested in certain subsets of \mathbb{T} associated with the algebras \mathcal{O}_{X} and $\mathcal{L}_{o,X}$ but first we require some definitions.

Suppose P is a subset of \prod . We say P is *-connected if for each $\alpha_i, \alpha_j \in P$ there exists $\beta_i, \ldots, \beta_m \in P$ such that $\alpha_i = \beta_i$, $\alpha_j = \beta_m$, and for i=1,...,m-l either $(\beta_i, \beta_{i+1}) \neq 0$ or β_{i+1} is an image

under the *-action of β_i . Maximal *-connected subsets of P are called *-components of P and it is clear that P is the disjoint union of its *-components.

Now, since $\sigma^* = \sigma w_{\sigma}$ for $\sigma \in \mathcal{A}$, where $w_{\sigma} \in \mathcal{V}_{\sigma}$, it follows that the actions $\propto ---- \sim \sigma^*$ and $\propto ----- \sim \sigma^*$ of \mathcal{A} permute the components of Σ in exactly the same way. It is clear then that \prod is *-connected if and only if \mathcal{A} is simple.

Applying this last paragraph to the algebra $[\mathcal{L}_e, \mathcal{J}_o]$ with index Π_o , it follows that there exists a 1-1 correspondence between simple summands of $[\mathcal{L}_o, \mathcal{L}_o]$ and non-empty *-components of Π_o . Indeed, if \mathcal{L}_o , is a simple summand of $[\mathcal{L}_o, \mathcal{L}_o]$ and Π_e , is a *-component of Π_o , then \mathcal{L}_e , and Π_o , correspond if and only if $(\mathcal{L}_o, \mathcal{L}_o)_K$ is the subalgebra generated by $\mathcal{L}_o((\mathcal{L}_K)_o, \mathcal{L}_K)_{-o}$. We say that \mathcal{L}_o , corresponds to \mathcal{L}_o , or \mathcal{L}_o , corresponds to \mathcal{L}_o .

Suppose next that P is a non-empty *-connected subset of \mathbb{T} .

Let P, be a component of P. It is clear that P is the disjoint union of the images of P, under the *-action. If the connected fundamental system P, is of type X, we say P is of *-type X. Let $A = \{\sigma \in A : P^* = P \}$ and $A = \{\sigma \in A : P^* = P \}$ and $A = \{\sigma \in A : P^* = A \}$ for all $A \in P$. Let $A \in A$ be the Roman numeral representing [A : A, A]. Then, if P is of type X, we say $A \in A$ (e.g. P is of *-type $A \in A$). Both definitions are clearly independent of our choice of P.

Suppose once again that $\chi \in \Sigma$. We define

$$\sum_{\sigma, \delta} = \left\{ \beta \in \Sigma_{\sigma} : \left(\mathcal{I}_{K} \right)_{\beta} \in \left(\mathcal{I}_{\sigma, \delta} \right)_{K} \right\}.$$

Equivalently, we may put

 $\sum_{o,v} = \left\{ \beta \in \sum_{o} : \beta = \omega_{o} - \omega_{o} \text{ for some } \omega_{o}, \omega_{o} \in \sum_{o} = \overline{\omega}_{o} = \overline{\omega}_{o} \right\}.$ Then, $\sum_{o,v} \text{ can be identified with the roots of } \left(\sum_{o,v} \right)_{K} \text{ with respect}$ to $\left(\int_{O} \int_{O_{o},v} \right)_{K}$. We put

The = Zen The.

 $\int_{o,y} \operatorname{can} \operatorname{be} \operatorname{identified} \operatorname{with} \operatorname{the} \operatorname{index} \operatorname{of} \operatorname{the} \operatorname{anisotropic} \operatorname{Lie} \operatorname{algebra} \mathcal{J}_{o,y}.$ Since $\mathcal{J}_{o,y}$ is an ideal of $[\mathcal{J}_{o},\mathcal{J}_{o}]$, it is clear that $\mathcal{J}_{o,y}$ is the union of *-components of \mathcal{J}_{o} . We note that in view of the Corollary to Prop. 2, if $\mathcal{J}_{o,y}$ is a *-component of \mathcal{J}_{o} with corresponding simple summand $\mathcal{J}_{o,y}$ of $[\mathcal{J}_{o},\mathcal{J}_{o}]$, then $\mathcal{J}_{o,y} \subseteq \mathcal{J}_{o,y}$ if and only if $\mathcal{J}_{o,y}$ acts non-trivially on \mathcal{J}_{v} in the adjoint action. We note also that $\mathcal{J}_{v,y} = \mathcal{J}_{o,y}$ and $\mathcal{J}_{o,y} = \mathcal{J}_{o,y}$, and hence $\mathcal{J}_{o,y} = \mathcal{J}_{o,y}$ and $\mathcal{J}_{o,y} = \mathcal{J}_{o,y}$.

Suppose now that $\forall \in \overline{\Pi}$. We recall that

is a *-orbit of Π . We put

Then, we can identify $(\Pi_{y}, \Pi_{o,y})$ with the index of $\mathcal{O}_{J_{y}}$ (with respect to the subalgebras $\{T_{y} \text{ and } f_{0} \in \mathcal{I}_{y}, f_{-y}\}$).

We wish next to give an interpretation of Π_{γ} and $\Pi_{e,\gamma}$ for $\gamma \in \overline{\Pi}$ in terms only of the index (Π, Π_e) . But first we require the following two lemmas:

Lemma 1: Let $P = \{\alpha_1, \beta_1, \dots, \beta_n \}$ be a fundamental system of roots and suppose $\alpha = \alpha_i + \sum_{i=1}^{n} m_i \beta_i$ is a root where the m_i are non-negative Proof: We may assume n > 1 and all the m are positive. Suppose for contradiction that $\alpha - \beta_j$ is not a root for all j. Then, $\alpha = \alpha_1 = \sum_{i=1}^n m_i \beta_i$ is a root and hence $\{\beta_1, \ldots, \beta_n\}$ is connected. there exists a unique element of $\{\beta_1,\ldots,\beta_n\}$, say β_i , which is connected to α_i . Now, if $\alpha = \alpha_i = \beta_j$ is a root for some j > 1, we have $(\alpha - \alpha - \beta_i, \alpha_i) = (\alpha - \alpha_i, \alpha_i) = (\sum_{i=1}^{n} m_i \beta_i, \alpha_i) < 0$ and hence $\alpha - \beta_i$ is a root. This gives a contradiction and so we may assume that $\ll - \ll - \ll - 8$; is not a root for j > 1. Thus, $\propto - < -\beta$, is a root. Then, $(\alpha - \alpha_i - \beta_i, \alpha_i) = (\sum_{i=0}^n m_i \beta_i + (m_i - 1)\beta_i, \alpha_i) = (m_i - 1)(\beta_i, \alpha_i). \quad \text{But } \alpha - \beta_i$ is not a root and hence $(\alpha - \alpha_i - \beta_i, \alpha_i) \geqslant 0$. Therefore, since $(\beta_i, \alpha_i) < 0$, we have $m_i = 1$. But $\alpha = \alpha_i = \beta_i + \sum_{i=0}^{n} m_i \beta_i$ and hence by induction on the number of elements in the fundamental system, $\ll - \ll - \ell_j$ is a root for some j>1. We have a contradiction. q.e.d.

Lemma 2: Let $\emptyset \in \overline{\Pi}$ and $\varnothing \in \Sigma$. Then, $\overline{\varnothing} = \emptyset$ if and only if $\varnothing = \varnothing_i + \sum_{\beta \in \overline{\Pi}_{i,\gamma}} m_{\beta} \beta$ for some $\varnothing_i \in \overline{U}_{\emptyset}$ and some non-negative integers m_{β} . Proof: Suppose $\overline{\varnothing} = \emptyset$. Then, $\overline{\varnothing} = \varnothing_i + \sum_{\beta \in \overline{\Pi}_{\emptyset}} m_{\beta} \beta$ for some $\overline{\varnothing}_i \in \overline{U}_{\emptyset}$ and non-negative integers m_{β} . By lemma 1, we may successively subtract elements of $\overline{\Pi}_{\emptyset}$ from this sum, each time producing an element of Σ , until we reach \varnothing_i . Thus, any $\beta \in \overline{\Pi}_{\emptyset}$ for which $m_{\beta} > 0$ is an element of $\overline{\Pi}_{\emptyset,\gamma}$. Therefore, $\overline{\varnothing} = \overline{\varnothing}_i + \sum_{\beta \in \overline{\Pi}_{\emptyset,\gamma}} m_{\beta} \beta$.

The converse is clear. q.e.d.

Corollary: Let $\emptyset \in \overline{\Pi}$. Then, \emptyset is in the Q-space generated by $\overline{\Pi}_{X}$.

Proof: Choose $\alpha \in \mathcal{O}_{\delta}$. Then, $\delta = \frac{1}{|\mathcal{S}|} \sum_{\sigma \in \mathcal{S}} \alpha^{\sigma}$. But $\alpha^{\sigma} = \delta$ for all $\sigma \in \mathcal{S}$ and the result follows from lemma 2. q.e.d.

We can now prove:

<u>Prop. 3</u>: Let $\forall \in \overline{\Pi}$ and $\beta \in \overline{\Pi}_o$. Then, $\beta \in \overline{\Pi}_o$, if and only if there exists $\alpha, \in \overline{O}_o$ and a subset P_o of $\overline{\Pi}_o$ such that $\beta \in P_o$ and $\{\alpha, \} \cup P_o$ is connected.

Proof: Suppose $\beta \in \Pi_{e,b}$. Then, there exists $\alpha \in \Sigma$ such that $\alpha = \gamma$ and $\alpha - \beta \in \Sigma$. Write $\alpha = \alpha + \sum_{\beta \in \Pi_{e,b}} m_{\beta} \beta$ as in lemma 2. Then, $\{\alpha, \beta \cup \beta \in \Pi_{e,b} : m_{\beta} > 0 \}$ is connected and $\beta \in \{\beta \in \Pi_{e,b} : m_{\beta} > 0 \}$. For the converse, put $\alpha = \alpha + \sum_{\beta \in \Gamma} \beta$ and apply lemma 2. q.e.d.

Corollary: Let $\forall \epsilon \, \overline{\Pi}$. Then, Π_{δ} is the *-component of $\Pi_{\delta} \cup \mathcal{O}_{\delta}$ containing \mathcal{O}_{δ} .

We now present two lemmas which concern themselves with the relationship between the restricted root system and the index. The first of these lemmas is Prop. 6.15 of Borel and Tits [1]. However, the proof is easy and so we present it.

Lemma 3: Let \forall and δ be distinct elements of \prod and suppose $\alpha, \epsilon \cup \emptyset$. Then, $(\forall, \delta) < 0$ if and only if there exists $\alpha, \epsilon \cup \emptyset$ and a subset P_{α} of \prod_{α} such that $\{\neg \emptyset \cup P_{\alpha} \cup \{\alpha, \delta\} \}$ is connected.

Proof: Suppose $(\forall, \delta) < 0$. Then, $\forall + \delta \in \sum$. Thus, there exists

 $\alpha \in \Sigma$ such that $\alpha = \forall + \delta$. Then, $\alpha = \alpha_1 + \alpha_4 + \sum_{\beta \in \Pi_0} m_{\beta} \beta$ for some $\alpha_3 \in \mathcal{O}_{\delta}$, $\alpha_4 \in \mathcal{O}_{\delta}$, and non-negative integers m_{β} . Therefore,

 $\{ \alpha_3, \alpha_4 \} \cup \{ \beta \in \Pi_0 : m_{\beta} > 0 \}$ is connected. Choose $\sigma \in \Delta$ such that $\alpha_1 = \alpha_3^{\sigma^*}$. Then, $\{ \alpha_1, \alpha_4^{\sigma^*} \} \cup \{ \beta \in \Pi_0 : m_{\beta} > 0 \}^{\sigma^*}$ is connected.

Conversely, suppose $\alpha_{2} \in \mathcal{O}_{\delta}$ and $\{\alpha_{i}\} \cup P_{0} \cup \{\alpha_{i}\} \}$ is connected. Then, $\alpha = \alpha_{i} + \alpha_{3} + \sum_{\beta \in P_{0}} \beta \in \Sigma$. Thus, $\overline{\alpha} = \delta_{i} + \delta_{3} \in \overline{\Sigma}$. q.e.d.

If P is a connected fundamental system of roots we denote by \mathcal{M}_{P} the dominant root for P i.e. the uniquely determined root with the property that \mathcal{M}_{P} + \propto is not a root for all \propto \in P.

Lemma 4: Let T be a non-empty connected subset of $\overline{\Pi}$. Put $\overline{\Pi}_{T} = \bigcup_{\delta \in T} \overline{\Pi}_{\delta}$. Let P be a connected component of $\overline{\Pi}_{T}$. Then, $\overline{\mathcal{M}_{P}} = \mathcal{M}_{T}$.

Proof: It clearly suffices to show that there exists $\prec_o \in \Sigma$ such that $\overline{\prec_o} = \mathcal{M}_T$ and \prec_o is a positive integral sum of elements in P. Now, there exists $\prec_i \in \Sigma$ such that $\overline{\prec_i} = \mathcal{M}_T$. We may write $\prec_i = \sum_{\alpha \in \Pi} m_{\alpha} < \infty$, with non-negative integers m_{α} . Then, $Q = \{ \prec \in \Pi : m_{\alpha} > 0 \}$ is a connected set such that $Q \subseteq \Pi_T$ and hence Q is contained in some component P_i of Π_T . But $P_i = P_i^{\sigma^*}$ for some $\sigma \in \Sigma$. Then, $\prec_o = \prec_o^{\sigma^*}$ is the required element. $Q \in \mathbb{R}$.

Lemma 4 with $T = \{ \}$ a singleton is Thm. 6.13(11) of Borel and Tits [1].

If $\mathcal X$ is simple, the action of $\mathcal X_o$ on certain restricted root spaces determines the number of simple summands of $\mathcal X_K$. We have:

<u>Prop. 4:</u> Suppose \mathcal{L} is simple and $\mathcal{L} \in \Sigma$ is of maximum length in Σ . Then, the number of simple summands of \mathcal{L}_K is equal to the number of irreducible summands in the decomposition of $(\mathcal{L}_{\mathcal{L}})_K$ as an $(\mathcal{L}_{\mathcal{L}})_K$ module. In particular, \mathcal{L} is central if and only if $\mathcal{L}_{\mathcal{L}}$ is an absolutely irreducible $\mathcal{L}_{\mathcal{L}}$ module.

<u>Proof:</u> By rechoosing Π if necessary, we may assume that δ is the dominant root for Π . Write $\mathcal{L}_K = \mathcal{L}_i \oplus \ldots \oplus \mathcal{L}_m$, where the \mathcal{L}_i are the simple summands of \mathcal{L}_K and write $(\mathcal{L}_k)_K = V_i \oplus \ldots \oplus V_n$, where the V_i are irreducible $(\mathcal{L}_i)_K$ modules.

For $i=1,\ldots,n$, let \mathcal{M}_i be the K-subspace of \mathcal{J}_K generated by $V_i \cup \left\{X \text{ ad}_K\left(X_i\right)...\text{ad}_{\mathcal{K}}\left(X_i\right): X \in V_i, X, \ldots, X_i \in \bigcup_{i \in \mathcal{N}} \left(\mathcal{J}_{-i}\right)_K\right\}$. It is easy to see that \mathcal{M}_i is an ideal of \mathcal{J}_K (using the facts that $[V_i,(\mathcal{J}_o)_K] \subseteq V_i$ and $[V_i,(\mathcal{J}_s)_K] = (0)$ for $S \in \overline{\mathbb{M}}$), $i=1,\ldots,n$. But from the definition of \mathcal{M}_i , it is immediate that $\mathcal{M}_i \cap (\mathcal{J}_s)_K = V_i$, $i=1,\ldots,n$. Thus, since V_i generates \mathcal{M}_i as an ideal for $i=1,\ldots,n$, it follows that $\mathcal{M}_i \cap \mathcal{M}_j = (0)$ for $1 \le i,j \le n$, $i \ne j$. Therefore, $n \le m$.

Since \mathcal{J} normalizes \mathcal{J}_i , $i=1,\ldots,m$, it follows that $(\mathcal{J}_{\gamma})_K = ((\mathcal{J}_{\gamma})_K \cap \mathcal{J}_i) \oplus \cdots \oplus ((\mathcal{J}_{\gamma})_K \cap \mathcal{J}_m)$. But since \mathcal{J} is simple, the \mathcal{J} module generated by \mathcal{J}_{γ} is \mathcal{J} . Thus, the \mathcal{J}_i module generated by $(\mathcal{J}_{\gamma})_K \cap \mathcal{J}_i$ is a non-zero $(\mathcal{J}_{\delta})_K$ submodule of $(\mathcal{J}_{\gamma})_K$. Thus, $m \leq n$.

Now K splits \mathcal{J} and hence \mathcal{J} is central if and only if m=1. But for the same reason, \mathcal{J}_{χ} is an absolutely irreducible \mathcal{J}_{o} module if and only if n=1. The final statement of the proposition is then immediate. q.e.d. Corollary: Suppose \mathcal{J} is simple, $\mathcal{X} \in \Pi$, and m \mathcal{X} is of maximal length in $\overline{\mathcal{D}}$ for some positive integer m. Then, the intersection of $\Pi_{\mathcal{X}}$ with each component of Π is a non-empty connected set. Proof: Let P be a connected component of Π and let $P_{\mathcal{X}} = P \cap \Pi_{\mathcal{X}}$. Now, Π is the disjoint union of images under the *-action of P. Thus, $\Pi_{\mathcal{X}}$ is the disjoint union of the same number of images under the *-action of $P_{\mathcal{X}}$. Thus, to prove the Corollary, it suffices to show that the number of components of $\Pi_{\mathcal{X}}$ is the same as the number of components of $\Pi_{\mathcal{X}}$ is the same as the

By the proposition, the number of components of T is equal to the number of irreducible summands of the $(\mathcal{L}_o)_K$ module $(\mathcal{L}_{m_Y})_{K^o}$. But $[\mathcal{L}_{m_Y}, \mathcal{L}_{-m_Y}] \in [\mathcal{L}_{\chi}, \mathcal{L}_{-\chi}]$ and $\mathcal{L}_o = \mathcal{O}_{m_Y} \oplus [\mathcal{L}_{m_Y}, \mathcal{L}_{-m_Y}]$. Thus, the number of irreducible summands of the $(\mathcal{L}_o)_K$ module $(\mathcal{L}_{m_Y})_K$ is equal to the number of irreducible summands of the $[\mathcal{L}_{\chi}, \mathcal{L}_{-\chi}]_K$ module $(\mathcal{L}_{m_Y})_{K^o}$. Applying the proposition to the algebra \mathcal{O}_{χ} , we have that the number of irreducible summands of the $[\mathcal{L}_{\chi}, \mathcal{L}_{-\chi}]_K$ module $(\mathcal{L}_{m_Y})_K$ is equal to the number of components of T_{χ} . q.e.d.

We close this chapter by introducing an action of the restricted Weyl group \overline{V} on \overline{T} and investigating some of its properties.

We need:

Lemma 5: Let $\overline{\mathbb{W}} \in \overline{\mathbb{W}}$. Then, there exists a unique element w of $\overline{\mathbb{W}}$, such that $\overline{\mathbb{W}}_0 = \overline{\mathbb{W}}_0$ and $\overline{\mathbb{W}}_0 = \overline{\mathbb{W}}$ for $w \in \Sigma$.

Proof: Since the map $\overline{\mathbb{W}}_0 = \overline{\mathbb{W}}_0$ is onto, there exists $w \in \overline{\mathbb{W}}_0$, such that $\overline{\mathbb{W}}_0 = \overline{\mathbb{W}}_0$ for $w \in \Sigma$. Now, $\overline{\mathbb{W}}_0$ is a fundamental

system for \sum . Therefore, there exists $w_o \in W_o$ such that $\prod_o^{W_o} W_o = \prod_o^{W_o} W_o$

It is clear that the map $\overline{W} \xrightarrow{J} w$ (with w as in lemma 3) is a group monomorphism of \overline{W} into W. We identify the elements of \overline{W} with their images under j. We then have

 $\prod_{o}^{\overline{W}} = \prod_{o} \text{ and } \overline{\alpha}^{\overline{W}} = \overline{\alpha}^{\overline{W}} \text{ for } \alpha \in \Sigma \text{ and } \overline{w} \in \overline{W}.$

This identification will be used throughout the rest of this work. It clearly depends on our choice of \prod_{o} . However, this dependence will not result in any confusion.

<u>Prop. 5</u>: W is the semi-direct product of W and W_o . For $\overline{W} \in W$ and $\sigma \in A$, we have $\sigma^* \overline{W} = \overline{W} \sigma^*$ and in particular $\overline{W} \mid \overline{\Pi}_o$ is a *-automorphism of $\overline{\Pi}_o$.

Proof: W_o is normal in W_o as we have remarked in Chapter 1. Let $w_o \in W_o$ and let \overline{w} be the image of w_o under the map $W_o = \overline{W}_o = \overline{W}_o$. Choose $w_o \in W_o$ such that $\overline{W}_o = \overline{W}_o = \overline{W}_o$. Then, $\overline{W}_o = \overline{W}_o = \overline{W}_$

Let $\overline{W} \in \overline{W}$ and $\sigma \in A$. Then, $\prod_{\sigma} \sigma^* \overline{W} \sigma^{*-1} = \prod_{\sigma}$ and $\overline{G} = \overline{W} G^{*-1} = \overline{W}$ for $A \in \Sigma$. But $\sigma^* \overline{W} \sigma^{*-1} \in V$. Thus, $G^* \overline{W} e^{*-1} = \overline{W}$. Therefore, $\sigma^* \overline{W} = \overline{W} \sigma^*$. q.e.d.

We also have:

Prop. 6: Let $\emptyset \in \Sigma$ and $\overline{W} \in \overline{W}$. Then, $\overline{\prod_{0,\delta} W} = \overline{\prod_{0,\delta} W}$. Moreover, if $\emptyset \in \overline{\Pi}$ and $\emptyset W \in \overline{\Pi}$, we have $\overline{O_{\delta}} = \overline{U_{\delta} W}$ and $\overline{\prod_{\delta} W} = \overline{\prod_{\delta} W}$. Proof: Put $\sum_{\delta} = \left\{ \alpha \in \Sigma : \alpha = \delta \right\}$ for $\delta \in \Sigma$. Now, $\overline{\prod_{\delta} W} = \overline{\prod_{\delta} W}$. $\overline{O_{\delta}} = \left\{ \alpha \in \Sigma_{\delta} : \alpha - \beta \notin \Sigma \right\}$ for $\beta \in \overline{\Pi_{\delta}} = \overline{M}_{\delta}$ and $\overline{\prod_{\delta} W} = \left\{ \beta \in \overline{\Pi_{\delta}} : \beta = \alpha_{\delta} - \alpha_{\delta} \text{ for some } \alpha_{\delta}, \alpha_{\delta} \in \Sigma_{\delta} \right\}$. Thus, it suffices to show that $\sum_{\delta} W = \sum_{\delta} W$. Let $\alpha \in \Sigma_{\delta}$. Then, $\alpha = \overline{M} = \overline{M}_{\delta} = \overline{M}_{\delta}$ and hence $\alpha \in \Sigma_{\delta} = \overline{M}_{\delta} = \overline{M}_{\delta$

By restriction, we have an action of $\overline{\mathbb{W}}$ on Π_δ which commutes with the *-action. We wish now to explicitly calculate this action for the reflections $\overline{\mathbb{W}}_\delta$, $\delta \in \overline{\Pi}$. For this calculation, we will need the following two lemmas:

Lemma 6: Let $\delta \in \Sigma$. Then, \overline{W}_{δ} is a product of reflections corresponding to roots in $\{\alpha \in \Sigma : \overline{\alpha} = \chi \notin U \prod_{\alpha, \delta} \text{ and } \overline{W}_{\delta} \text{ fixes} \}$ the elements of $\prod_{\alpha} - \prod_{\alpha, \delta}$.

Proof: The roots of $(f_{\chi} \cap [\mathcal{L}_{\chi}, \mathcal{L}_{-\chi}])_{K}$ in $(\mathcal{O}_{\chi})_{K}$ can be identified with $f_{\chi} \in \Sigma$: $\chi \neq 0$, $\chi \in \mathbb{Z} \times \{ \mathcal{O}_{\chi} \setminus \mathcal{O}_{\chi} \}$, and a fundamental system for these roots is contained in $f_{\chi} \in \Sigma$: $\chi = \chi f_{\chi} \cup \mathcal{O}_{\chi} \setminus \mathcal{O}_{\chi}$. Applying lemma 5 to the algebra \mathcal{O}_{χ} and the only non-trivial element of its restricted Weyl group, it follows that there exists a product w of

reflections corresponding to roots in $\{ \alpha \in \Sigma : \alpha = Y \} \cup \Pi_{0,\delta}$ such that $\Pi_{0,\delta}^{W} = \Pi_{0,\delta}^{W}$ and $\{ \alpha \in \Sigma : \alpha = Y \} \cup \{ \alpha \in \Sigma : \alpha =$

It remains to show that $w = \overline{w}_{\delta}$. Since $\prod_{i,\delta}^{W} = \prod_{i,\delta}^{Q}$, we have $\prod_{i,\delta}^{W} = \prod_{i,\delta}^{Q}$. Since w is a product of elements of $\{ \bowtie \epsilon \succeq : \vec{\bowtie} = \emptyset \} \cup \prod_{i,\delta}^{Q}$, it follows that $\mathcal{E}^{W} = \mathcal{E}$ for all $\mathcal{E} \in \mathcal{X}_{\succeq}$ such that $(\mathcal{E}, \mathcal{X}) = 0$, and $\mathcal{X}^{W} \in \mathbb{Q} \times \mathbb{Q}$. Put $\mathcal{X}^{W} = q \times \mathbb{Q}$. Then, for $\cong \epsilon \succeq \mathbb{Z}$ such that $\vec{\bowtie} = \mathbb{Z} \times \mathbb{Q}$, we have $-\mathcal{X} = \vec{\bowtie} = q \times \mathbb{Q} = q \times \mathbb{Q}$. Therefore, q = -1. Thus, w stabilizes $\vec{\bowtie} = \mathbb{Z} \times \mathbb{Q} \times \mathbb{Z} = \mathbb{Z} \times \mathbb{Q} \times \mathbb{Z}$. Therefore, $\vec{\bowtie} = \mathbb{Z} \times \mathbb{Z}$

We recall a definition. Let P be a fundamental system of roots (not necessarily reduced). Let w be the unique element of the Weyl group of P such that $P^W = -P$. The map $\propto \longrightarrow -\infty^W$ is an automorphism of P and is called the opposition involution of P. It is denoted by i_p . If P, is a component of P, then $P_i^{i_p} = P_i$ and $i_p P_i = i_p$. If P is connected, then i_p is trivial unless P is reduced and of type $A_n(n \ge 2)$, E_0 , or $D_n(n > 4)$, n odd) in which case i_p is the unique non-trivial automorphism of P. Lemma 7: Let T be a non-empty subset of $\overline{\prod}$. Put $\overline{\prod}_T = \bigcup_{i \in T} \overline{\prod}_{i \in T}$ and $\overline{\prod}_{To} = \bigcup_{i \in T} \overline{\prod}_{e_i}$. Let \overline{w} be the uniquely determined product of elements of $\{\overline{w}_k: k \in T\}$ such that $T^W = -T$. Then,

and \overline{W} stabilize Π_{TO} , and $\overline{W}|\Pi_{TO} = (i_{\Pi_T} \prod_{TO}) \circ i_{\Pi_{TO}}$. If $\emptyset \in T$, we have $O_{N}^{i_{\Pi_T}} = O_{N_{N}^{i_{T}}}$, $\prod_{0,N}^{i_{\Pi_T}} = \prod_{0,N^{i_{T}}}$, and $\prod_{N}^{i_{\Pi_T}} = \prod_{i=1}^{i_{I_{TO}}}$. Proof: Let $\emptyset \in T$. Then, \overline{W}_N is a product of reflections corresponding to elements of $\bigcap_{0,N} = \bigcup_{i=1}^{N_{N}} \sum_{i=1}^{N_{N}} \sum_{i$

By the above, \overline{w} is a product of reflections corresponding to elements of $\overline{\prod}_T$ and \overline{w} fixes the elements of $\overline{\prod}_{T^0}$. Therefore, \overline{w} stabilizes $\overline{\prod}_{T^0}$. Let w_o be the uniquely determined product of reflections corresponding to elements of $\overline{\prod}_{T^0}$ such that $\overline{\prod}_{T^0} = -\overline{\prod}_{T^0}$. For $\omega \in \overline{\prod}_T - \overline{\prod}_{T^0}$, $\overline{\omega}^{\overline{w}} w_o = \overline{\omega}^{\overline{w}} = \overline{\omega}^{\overline{w}}$ and hence $\omega^{\overline{w}} w_o = \overline{\prod}_{T^0}$. But for $\beta \in \overline{\prod}_{T^0}$, $\beta^{\overline{w}} w_o = \overline{\omega}^{\overline{w}}$ and hence $\omega^{\overline{w}} w_o = \overline{\prod}_{T^0}$. Since \overline{w} w, is a product of reflections corresponding to elements of $\overline{\prod}_T$, we have \overline{w} w, $\overline{\prod}_T = -i_{\overline{m}_T}$. Therefore, \overline{w} $\overline{\prod}_{T^0} = (i_{\overline{m}_T} | \overline{\prod}_{T^0}) \cdot i_{\overline{m}_{T^0}}$.

Let $\sum_{\overline{w}} = \sum_{\overline{w}} (-\overline{w}) w_o = \sum_{\overline{w}} i_{\overline{w}} = \sum_{\overline{w}} i_{\overline{w}}$. The last statement of the lemma is then clear. q.e.d.

We can now prove:

Prop. 7: Let $\forall \in \Sigma$. Then, \overline{w}_{s} fixes the elements of Π_{o} - $\Pi_{c,s}$.

If $\forall \in \overline{\Pi}$, then $i_{\overline{\Pi}_{s}}$ stabilizes $\Pi_{c,s}$ and \overline{U}_{s} , and $\overline{w}_{s} \mid \Pi_{o,s} = (i_{\overline{\Pi}_{s}} \mid \Pi_{o,s}) \cdot i_{\overline{\Pi}_{c,s}}$.

Proof: The first statement is part of lemma 6. The second statement is a consequence of lemma 7 with $T = \{ \}$, q.e.d.

If $\delta \in \Pi$, we can calculate the action of $[\mathcal{L}_{o}, \mathcal{L}_{o}]_{K}$ on $(\mathcal{L}_{\delta})_{K}$ using our action of \overline{W} on Π_a . Prop 8: Let $\% \overline{\Pi}$. Write $\overline{U}_{X} = \{\alpha_{1}, \dots, \alpha_{s} \}$. For $\beta \in \Pi_{0}$, let λ_s be the fundamental dominant integral weight of $(f_{\alpha} [f_{\alpha}, f_{\alpha}])_{K}$ corresponding to β . Let $\lambda_i = \sum_{A \in \mathcal{H}} -(\sim_i, \widehat{\beta}) \lambda_B \overline{w}_B$, i=1,...,f. Then, as an $[\mathcal{J}_{o},\mathcal{J}_{o}]_{K}$ module, $(\mathcal{J}_{y})_{K}$ is isomorphic to the direct sum of the firreducible $\left[\mathcal{J}_{o},\mathcal{J}_{o}
ight]_{\mathrm{K}}$ modules with highest weights $\lambda_1, \ldots, \lambda_s$. <u>Proof</u>: The weights of the representation of $[J_o,J_o]_K$ in $(J_b)_K$ are $\{ \propto I(f \cap [\mathcal{L}_o, \mathcal{L}_o])_K : \sim \in \Sigma \text{ and } Z = Y \}$. Thus, the highest weights of the irreducible summands of this representation are $f \propto |(f \cap [f_0, f_0])_K : \propto \epsilon \sum_{k} = \delta_k, \text{ and } \alpha + \beta \notin \sum_{k} \text{ for } \beta \in \Pi_0 f$. But $a = -\gamma$ for $a \in \Sigma$ such that $\Xi = \gamma$ and $\prod_{o} \overline{W_{o}} = \prod_{o}$. Thus, $\overline{\mathbf{w}}_{\mathbf{x}}$ takes these highest weights onto $\{\alpha \mid (\{ n \mid \mathcal{L}_o, \mathcal{L}_o \mid)_K : \alpha \in \Sigma, \alpha = -8, \text{ and } \alpha + \beta \notin \Sigma \text{ for } \beta \in \Pi_o \}$. But (by lemma 1) this last set is $\{-\alpha/(f_0,f_0,f_0)\}_K: \alpha \in \mathcal{T}_{\mathcal{F}}\}$. Therefore, the highest weights of the irreducible summands of the representation of $[\mathcal{L}_{o},\mathcal{L}_{o}]_{K}$ in $(\mathcal{L}_{o})_{K}$ are

 $\begin{cases}
-\alpha_{i}^{\overline{W}_{\delta}} | (f_{0} [f_{o}, f_{o}])_{K} : i=1,...,f \}. \text{ But} \\
(-\alpha_{i}^{\overline{W}_{\delta}}, \widehat{\beta}^{\overline{W}_{\delta}}) = -(\alpha_{i}, \widehat{\beta}) = (\lambda_{i}, \widehat{\beta}^{\overline{W}_{\delta}}) \text{ for } \beta \in \overline{\mathbb{N}}_{o} \text{ and } i=1,...,f. q.e.d.
\end{cases}$

Chapter 3

The Restricted Diagram and the Index

In this chapter, we study the relationship between the restricted diagram and the index of an algebra. We will assume throughout the chapter that \mathcal{L} is a simple algebra over \mathcal{R} and that \mathcal{I} , \mathcal{L} , \mathcal{K} , \mathcal{L} , \mathcal{I} , \mathcal{I} , etc. are as in Chapter 1. We also use the notation of Chapter 2.

Our method of deducing some facts about the index (Π, Π_o) will be to first prove a result about the indices $(\Pi_g, \Pi_{o,g})$, $\emptyset \in \Pi$, and then concern ourselves with how these indices fit together. In order to prove the result about the indices $(\Pi_g, \Pi_{o,g})$, $\emptyset \in \overline{\Pi}$, we will need the following lemma:

Lemma 1: Let P be a connected fundamental system of roots. Let $\alpha \in P$ and suppose α has coefficient 1 in the dominant root for P. Then, either P is of type A or $P = \{\alpha\}$ is connected.

Proof: We may assume $P = \{\alpha'_j \neq \emptyset$. Let $\mathcal{M}_P = \alpha' + \sum_{\beta \in P - \{\alpha'_j\}} m_{\beta} \beta$ be the dominant root for P. Let P_1, \ldots, P_k be the components of $P = \{\alpha'_j\}$. Then, there exists a unique element \mathcal{B}_i of P_i such that α and \mathcal{B}_i are connected, $i=1,\ldots,t$. But then $0 \leq (\mathcal{M}_P,\widehat{\alpha}) = 2 + \sum_{i=1}^{L} m_{\beta_i}(\beta_i,\widehat{\alpha})$ and hence $\sum_{i=1}^{L} m_{\beta_i}(-(\beta_i,\widehat{\alpha})) \leq 2$. If t=1, then $P = \{\alpha'_j\}$ is connected and we are done. Suppose $t \geq 2$. Since $-(\beta_i,\widehat{\alpha})$ is a positive integer for $i=1,\ldots,t$, we have t=2, $m_{\beta_i} = m_{\beta_i} = 1$, and $-(\beta_i,\widehat{\alpha}) = -(\beta_i,\widehat{\alpha}) = 1$. Now, $\alpha = (\alpha,\widehat{\beta_i})\beta_i$ is a root and hence $-(\alpha,\widehat{\beta_i}) \leq m_{\beta_i}$, i=1,2. Therefore, $-(\alpha,\widehat{\beta_i}) = 1$, i=1,2. Thus, $\{\alpha,\beta_i\}$ is a segment of

type A_2 , i=1,2. Now, the coefficient of β_i in the dominant root for $P_i \cup \{\alpha\}$ is less than or equal to m_{β_i} and hence is 1, i=1,2. Thus, by induction on the number of elements in P, either $P_i \cup \{\alpha\}$ is of type A or $(P_i \cup \{\alpha\}) - \{\beta_i\}$ is connected, i=1,2. But if $(P_i \cup \{\alpha\}) - \{\beta_i\}$ is connected, it follows that $P_i = \{\beta_i\}$ and hence $P_i \cup \{\alpha\} = \{\alpha, \beta_i\}$ is of type A_2 , i=1,2. Thus, in any case $P_i \cup \{\alpha\}$ is of type A, i=1,2. Thus, in any case $P_i \cup \{\alpha\}$

We can now prove:

<u>Prop.1</u>: Let $\emptyset \in \Pi$ and suppose $2 \emptyset \notin \Sigma$. Then, either $\Pi_{0,\emptyset}$ is *-connected or $(\Pi_{\emptyset}, \Pi_{0,\emptyset})$ is of the form:

where the two **-components of $\Pi_{\chi_{i}}$ contain the same number of elements. Proof: Let P be a connected component of Π_{χ} . Put $P_{o} = \Pi_{o,\chi} \cap P$ and $P_{\chi} = \mathcal{O}_{b} \cap P$. Then, Π_{χ} (resp. $\Pi_{o,\chi}$; \mathcal{O}_{χ}) is the disjoint union of images of P (resp. P_{o} ; P_{χ}) under the *-action. Let \mathcal{M}_{p} be the dominant root for P. Then, by lemma 2.4, $\mathcal{M}_{p} = \mathcal{V}$. Hence, P_{χ} is a singleton $\{\alpha_{\chi}^{i}\}$ and the coefficient of α in \mathcal{M}_{p} is 1. Then, $P_{o} = P - \{\alpha_{\chi}^{i}\}$ and, by lemma 1, either P is of type A or P_{o} is connected. If P_{o} is connected, then $\Pi_{o,\chi}$ is *-connected. Suppose P is of type A_{n} . But, by Prop. 2.7, $\mathbf{1}_{\Pi_{\chi}}$ stabilizes \mathcal{O}_{χ} and hence, since $\mathbf{1}_{\Pi_{\chi}} \mid P = \mathbf{1}_{p}$, $\alpha^{i}P = \alpha$. Therefore, n is odd and α is the middle root of P. If $P_{o} \neq \Phi$ and there exists $\alpha \in \mathcal{A}$ such that $P^{\alpha *} = P$ and α^* exchanges the two components of P_{o} , then Π_{χ} is of *-type $A_{n,i}$ and $\Pi_{o,\chi}$ is *-connected. Otherwise, $(\Pi_{\chi}, \Pi_{o,\chi})$ is of the form (2). q.e.d. We concern ourselves now with how the Π_{\aleph} , ${\mathscr C}\in\Pi$, fit together. We begin by proving four lemmas which will be useful in this regard. The first of these deals with the intersections of the $\Pi_{{\mathfrak C},{\mathscr C}}$, ${\mathscr C}\in\Pi$, with each other.

Lemma 2: Let X and X be distinct elements of Σ .

- (1) If $\forall, \delta \in \overline{\Pi}$, then $\overline{\Pi_{\sigma, \forall}} \cap \overline{\Pi_{\sigma, \delta}}$ is *-connected.
- (ii) If $\delta + \delta \notin \overline{\Sigma}$ and $\delta \delta \notin \overline{\Sigma}$, then $\overline{\prod_{o,\delta}} \cap \overline{\prod_{o,\delta}} = \phi$.

 Proof: Suppose $\delta \in \overline{\Sigma}$. Suppose for contradiction that $\overline{\prod_{o,\delta}} \cap \overline{\prod_{o,\delta}}$ contains two distinct non-empty *-components $\overline{\prod_{o,\delta}}$ and $\overline{\prod_{o,\delta}}$. It follows immediately from Prop. 2.3 that there exists $\alpha \in \overline{\bigcup_{\delta}}$, $\alpha_{\lambda} \in \overline{\bigcup_{\delta}}$, and a subset $P_{o,\delta}$ of $\overline{\prod_{o,\delta}}$ such that $\{\alpha_{\delta} \in \overline{\bigcup_{\delta}} \cap P_{o,\delta} \cap P_{$

Suppose $\Im + \Im \notin \sum$ and $\Im - \Im \notin \sum$. Suppose for contradiction that there exists $\beta \in \prod_{0, \chi} \cap \prod_{0, \bar{\lambda}}$. Then, there exists $\alpha_1, \alpha_2, \alpha_3, \alpha_4 \in \sum$ such that $\beta = \alpha_1 - \alpha_3 = \alpha_2 - \alpha_4$, $\overline{\alpha_1} = \overline{\alpha_3} = \chi$, and $\overline{\alpha_2} = \overline{\alpha_4} = \Im$.

Then, $\alpha_1 + \alpha_2 \notin \sum$ and $\alpha_1 - \alpha_3 \notin \sum$ and hence $(\alpha_1, \alpha_2) = 0$. Similarly, $(\alpha_1, \alpha_4) = 0$. Therefore, $(\alpha_1, \beta) = 0$. Similarly, $(\alpha_3, \beta) = 0$.

Thus, $(\beta, \beta) = 0$ and we have a contradiction. (ii) is proved. q.e.d.

Lemma 3: Suppose γ and δ are distinct elements of \sum such that $(\gamma, \delta) < 0$. Then,

 $(\Pi_{s} - \Pi_{s}) \cup (\Pi_{s} - \Pi_{s}) \subseteq \Pi_{s,s+s}$.

Proof: It suffices to show that $\Pi_{0,k} - \Pi_{0,k} \leq \Pi_{0,k+k}$. Let $\beta \in \Pi_{0,k} - \Pi_{0,k}$. Then, there exists $\alpha \in \Sigma$ such that $\overline{\alpha}_i = k$ and $\alpha_i + \beta \in \Sigma$. By replacing α_i with the element of least height in the β -chain containing α_i , we may assume $\alpha_i - \beta \notin \Sigma$. Therefore, $(\alpha_i, \beta) < 0$. Choose $\alpha_i \in \Sigma$ such that $\overline{\alpha_i} = k$. Then, $0 > (k, k) = (\frac{1}{|k|} \sum_{\sigma \in k} \alpha_i^{\sigma}, k) = \frac{1}{|k|} \sum_{\sigma \in k} (\alpha_i, k) = \frac{1}{|k|} \sum_{\sigma \in k} (\alpha_i, k) = \frac{1}{|k|} \sum_{\sigma \in k} (\alpha_i, \alpha_i^{\sigma})$. Thus, $(\alpha_i, \alpha_i^{\sigma}) < 0$ for some $\sigma \in A$. Replacing α_i by α_i^{σ} , we may assume $(\alpha_i, \alpha_i) < 0$. Since $\beta \notin \Pi_{0,k}$, we have $\alpha_i - \beta \notin \Sigma$ and $\alpha_i + \beta \notin \Sigma$. Therefore, $(\alpha_i, \beta) = 0$. But $\alpha_i + \alpha_i \in \Sigma$. Therefore, $(\alpha_i, \beta) = 0$, and hence $\alpha_i + \alpha_i + \beta \in \Sigma$. Therefore, $\beta \in \Pi_{0,k+k}$, q.e.d.

Lemma 4: Let $\Pi_{o,i}$ and $\Pi_{o,j}$ be *-components of Π_{o} . Then, there exists $\delta \in \mathbb{Z}$ such that $\Pi_{o,i} \cup \Pi_{o,j} \subseteq \Pi_{b,j}$.

Proof: If $\Pi_{o,i} \cup \Pi_{o,j} \subseteq \Pi_{o,j}$ for some $\delta \in \Pi$, we are done. Suppose not. Then, since Π is connected, there exists distinct $\delta_{i}, \ldots, \delta_{k} \in \Pi$ such that $t \geq 2$, $(\delta_{i}, \delta_{i}) \leq 0$ for $i=1,\ldots,t-1$, $\Pi_{o,i} \leq \Pi_{o,\delta_{i}}$, $\Pi_{o,i} \notin \Pi_{o,j} \leq 0$ for $i=1,\ldots,t-1$, $\Pi_{o,i} \leq \Pi_{o,\delta_{i}}$, $\Pi_{o,i} \notin \Pi_{o,j} \leq 0$ for $i=1,\ldots,t-1$. This is clear for i=1. If 1 < i < t and $\Pi_{o,i} \subseteq \Pi_{o,\delta_{i}+\cdots+\delta_{k-1}}$ for $i=1,\ldots,t$. This is clear for i=1. If 1 < i < t and $\Pi_{o,i} \subseteq \Pi_{o,\delta_{i}+\cdots+\delta_{k-1}}$, then $\Pi_{o,i} \subseteq \Pi_{o,\delta_{i}+\cdots+\delta_{k-1}} \cap \Pi_{o,i} \subseteq \Pi_{o,\delta_{i}+\cdots+\delta_{k-1}} \cap \Pi_{o,i} \subseteq \Pi_{o,\delta_{i}+\cdots+\delta_{k-1}}$ and hence, by lemma 3, $\Pi_{o,i} \subseteq \Pi_{o,\delta_{i}+\cdots+\delta_{k-1}}$. If $\Pi_{o,i} \subseteq \Pi_{o,\delta_{i}+\cdots+\delta_{k-1}}$ putting $\delta = \delta_{i} + \cdots + \delta_{t-1}$ we are done. Otherwise, $\Pi_{o,i} \subseteq \Pi_{o,\delta_{i}+\cdots+\delta_{k-1}}$ and hence, by lemma 3, $\Pi_{o,i} \subseteq \Pi_{o,\delta_{i}+\cdots+\delta_{k-1}} \cap \Pi_{o,i} \subseteq \Pi_{o,\delta_{i}+\cdots+\delta_{k-1}} \cap \Pi_{o,\delta_{i}+\cdots+\delta_{k-1}} \cap \Pi_{o,i} \subseteq \Pi_{o,\delta_{i}+\cdots+\delta_{k-1}} \cap \Pi_{o,\delta_{i}+\cdots+\delta_{k-1}}$

For the purposes of the following lemma, we put $A_{\gamma,\delta} = 2\frac{(\gamma,\delta)}{(\gamma,\delta)}$ for $\gamma, \delta \in \sum$.

Lemma 5: Suppose \forall , $\delta \in \Sigma$. Suppose \forall $= \delta \notin \Sigma$ and $2 \forall \notin \Sigma$. Then:

(i)
$$A_{8,8} = A_{8,8} = 0 \longrightarrow \prod_{a,b} \cap \prod_{a,b} = \phi$$
.

(ii)
$$A_{x,s} = A_{s,x} = -1 \longrightarrow \prod_{o,s} \cap \prod_{o,s} \neq \phi$$
 whenever $\prod_{o,s} U \prod_{o,s} \neq \phi$.

(iii)
$$A_{8,8} = -1$$
, $A_{8,8} = -2$ $\longrightarrow \prod_{\sigma,\delta} \subseteq \prod_{\sigma,\gamma}$ and, if $\prod_{\sigma,\delta}$ is *-connected, $\prod_{\sigma,\delta} = \phi$.

(iv)
$$A_{\delta,\delta} = -1$$
, $A_{\delta,\delta} = -3 \longrightarrow \bigcap_{\delta,\delta} = \phi$.

<u>Proof:</u> (i) follows from lemma. 2(ii). To prove (ii), (iii), and (iv), we may assume $A_{8,8} = -1$ and $A_{8,8} = -p$, where p=1,2, or 3. By lemma 3, $\Pi_{0,8} - \Pi_{0,3} \subseteq \Pi_{0,3+5} \cap \Pi_{0,8}$. But by Prop. 2.7, \overline{W}_8 fixes the elements of $\Pi_{0,8} - \Pi_{0,8}$. Hence, operating on both sides of $\Pi_{0,8} - \Pi_{0,8} \subseteq \Pi_{0,8+5} \cap \Pi_{0,8}$ with \overline{W}_8 , we obtain $\Pi_{0,8} - \Pi_{0,8} \subseteq \Pi_{0,9+1,3+5} \cap \Pi_{0,9+5}$. Since p = 1,2, or 3, combining our two inclusions we obtain

$$\Pi_{o,S} - \Pi_{o,N} \subseteq \bigcap_{i=o}^{p} \Pi_{o,iN+S}.$$
(3)

Suppose p=1. Suppose for contradiction that $\Pi_{o,8} \cap \Pi_{o,8} = \Phi$ and $\Pi_{o,8} \cup \Pi_{c,8} \neq \Phi$. By (3), $\Pi_{o,8} \subseteq \Pi_{o,8+8}$. Operating on both sides of this inclusion with \overline{w}_8 , we obtain $\Pi_{o,8} \subseteq \Pi_{o,8}$. Similarly, $\Pi_{o,8} \subseteq \Pi_{o,8}$. Therefore, $\Pi_{o,8} = \Pi_{o,8}$ and we have a contradiction since $\Pi_{o,8} \cap \Pi_{o,8} = \Pi_{o,8} \cup \Pi_{o,8}$. (ii) is proved.

Suppose $p \ge 2$. Now, $\forall + \delta = \sqrt[8]{w_{\delta}}$ and hence $2\forall + 2\delta \notin \overline{\Sigma}$. Thus, $(2\forall + \delta) + \delta \notin \overline{\Sigma}$ and $(2\forall + \delta) - \delta \notin \overline{\Sigma}$. Thus, by lemma 2(ii), $\prod_{o, \delta} + \delta \cap \prod_{o, \delta} = \phi$. Thus, by (3), $\prod_{o, \delta} - \prod_{o, \delta} = \phi$. Therefore, $\prod_{o, \delta} \subseteq \prod_{o, \delta}$.

Suppose p = 2 and $\prod_{o, b}$ is *-connected. Then, $\prod_{o, b \neq b} \mathbb{I}_{o, b} = \prod_{o, b} \mathbb{I}_{o, b} = \prod_{o, b} \mathbb{I}_{o, b}.$ Therefore, $\prod_{o, b \neq b} \mathbb{I}_{o, b}$ and $\prod_{o, b}$ are two disjoint subsets of $\prod_{o, b}$. Thus, $\prod_{o, b} \mathbb{I}_{o, b} = \emptyset$ or $\prod_{o, b \neq b} \mathbb{I}_{o, b} = \emptyset$.

But $\prod_{o, b \neq b} \mathbb{I}_{o, b} = \prod_{o, b} \mathbb{I}_{o, b}$. Therefore, $\prod_{o, b} \mathbb{I}_{o, b} = \emptyset$. (iii) is proved.

Suppose p = 3. Now, by Prop. 2.7, $\prod_{o, b} \mathbb{I}_{o, b} = \prod_{o, b} \mathbb{I}_{o, b}$ (since $\prod_{o, b} \mathbb{I}_{o, b} = \prod_{o, b} \mathbb{I}_{o, b} = \prod_{o, b} \mathbb{I}_{o, b} = \prod_{o, b} \mathbb{I}_{o, b}$. Thus, $\prod_{o, b \neq b} \mathbb{I}_{o, b} = \prod_{o, b} \mathbb{I}_{o, b} = \prod_{o, b} \mathbb{I}_{o, b} = \prod_{o, b} \mathbb{I}_{o, b}$. (iv) is proved. q.e.d.

The first consequence of these lemmas is:

Prop. 2: Suppose $\overline{\Pi}$ is reduced. Let $\overline{\Pi_{o,i}}$ and $\overline{\Pi_{o,i}}$ be two *-components of $\overline{\Pi_{o}}$. Then, there exists $\overline{w} \in \overline{W}$ such that $\overline{\Pi_{o,i}} = \overline{\Pi_{o,i}}$.

Proof: We may assume $\overline{\Pi_{o,i}} \neq \overline{\Pi_{o,i}}$. By lemma 4, there exists $\overline{W} \in \overline{\Sigma}$ such that $\overline{\Pi_{o,i}} \cup \overline{\Pi_{o,i}} \subseteq \overline{\Pi_{o,i}}$. But there exists $\overline{W} \in \overline{W}$ such that $\overline{W} \in \overline{\Pi}$. Put $S = \overline{W} = \overline$

We will refer in what follows to indices of the form:

(4)

where all the *-components of the anisotropic part of this index contain the same number of elements. If we wish to specify the number t of distinguished orbits, we say that the index is of the form (4)_t.

The following lemma will be useful in studying subsets T of $\overline{\prod}$ of type A.

Lemma 6: Let T be a non-empty connected subset of $\overline{\prod}$ of type A_t .

Put $\prod_{T} = \bigcup_{y \in T} \prod_{y}$ and $\prod_{To} = \bigcup_{y \in T} \prod_{o, y}$. Then, exactly one of the following holds:

- (a) Π_{TO} is *-connected $\neq \phi$.
- (b) (\prod_T, \prod_{To}) is of the form (4).

 Moreover, if (a) holds, then t=1 or 2 and $\prod_{TO} = \prod_{o, \forall}$ for all $\forall \in T$.

 Proof: Let \sum_T be the set of restricted roots which are positive or negative integral combinations of elements of T. Label the roots of T as follows:

Suppose first of all that (a) holds and t>1. Then, $\Pi_{o,\forall} \neq \phi$ for some $\forall \in T$. Since all elements of T are conjugate under \overline{V} , $\Pi_{o,\forall} \neq \phi$ for all $\forall \in T$. Thus, $\Pi_{o,\forall} = \Pi_{To}$ for all $\forall \in T$. Then, for $\forall \neq \delta \in T$, $\Pi_{o,\forall} \cap \Pi_{o,\delta} \neq \phi$ and hence, by lemma 2(ii), $\forall + \delta \in \overline{\Sigma}$. Thus, t=2.

It remains to show that if Π_{TO} is empty or not *-connected, then (Π_T,Π_{TO}) is of the form (4). If $\Pi_{TO}=\phi$, this is clear. Suppose Π_{TO} is not *-connected. Now, from the proof of lemma 4, it follows that any two *-components of Π_{TO} are contained in $\Pi_{o,\delta}$ for some $\delta \in \Sigma_T$. Since all elements of Σ_T are conjugate under \widetilde{V} , $\Pi_{o,\delta}$ contains two non-empty *-components for all $\delta \in \Sigma_T$. By Prop. 1, $(\Pi_{\delta},\Pi_{o,\delta})$ is of the form (2) for all $\delta \in T$. We prove by induction on i that $(\Pi_{\delta},\cup\ldots\cup\Pi_{\delta_i},\Pi_{o,\delta_i},\cup\ldots\cup\Pi_{o,\delta_i})$ is of the form (4) for i=1,...,t. We have this for i=1. Suppose $1 < i \le t$ and

 $(\Pi_{s_i} \cup \ldots \cup \Pi_{s_{i-1}}, \Pi_{o,s_i} \cup \ldots \cup \Pi_{o,s_{i-1}})$ is of the form $(4)_{i-1}$. By lemma 5(ii), $\prod_{e_i,v_{i-1}} \cap \prod_{e_i,v_{i+1}} \phi$ and, by lemma 2(i), $\prod_{e_i,v_{i-1}} \cap \prod_{e_i,v_{i-1}}$ is *-connected. But if 1>2, $\prod_{o_i v_i} \cap \prod_{o_i v_i} = \phi$ for $1 \le j \le i-2$ (since $y_i + y_i \notin \sum$). Thus, $\prod_{o_i \neq i-1} \cap \prod_{o_i \neq i}$ is one of the *-components of $\prod_{i,j}$ and, if i > 2, $\prod_{i,j} \cap \prod_{i,j=1}^{n}$ is not one of the *-components of $\prod_{o,v} \cup \dots \cup \prod_{o,v_{i-a}}$. Since $(\prod_{v_i}, \prod_{o,v_i})$ is of the form (2), the result is then clear. q.e.d.

We can now prove some results about the relationship between the restricted diagram Π and the index (Π, Π_0) . We will consider successively the cases $\overline{\Pi}$ of type A, $\overline{\Pi}$ of type D or E, $\overline{\Pi}$ of type B,C,F, or G, and $\overline{\prod}$ not reduced.

Prop. 3: Suppose $\overline{\prod}$ is of type A_r $(r \ge 1)$. Then, exactly one of the following holds:

- (a) r=1 or 2 and \mathcal{T}_o is *-connected $\neq \phi$.
- (b) (Π, Π_o) is of the form (4).

<u>Proof</u>: This follows from lemma 6 with $T = \overline{II}$. q.e.d.

Prop. 4: Suppose $\overline{\prod}$ is of type D_r $(r \ge 4)$ or E_r (r=6,7, or 8). Then, $\Pi = \phi$.

<u>Proof:</u> We choose a subdiagram of $\overline{\Pi}$ of type D_4 , labelled

Suppose for contradiction that $\prod_{b} \neq \phi$. Since all the roots of $\overline{\Pi}$ are conjugate under \overline{W} , we have $\Pi_{3} \neq \phi$. Put $T_{3} = \{\lambda, \lambda_{3}, \lambda_{3}\}$ and $T_{4} = \{ \delta_{1}, \delta_{2}, \delta_{4} \}$ and apply lemma 6. Since T_{3} and T_{4} contain three elements each, we have that $(\Pi_{s_1} \cup \Pi_{s_2} \cup \Pi_{s_3}, \Pi_{o,s_3} \cup \Pi_{o,s_3} \cup \Pi_{o,s_3})$ and $(\prod_{s_i} \cup \prod_{s_{i+1}} \cup \prod_{s_{i+1}} \cup \prod_{s_i \in S_i} \cup \prod_{s_i \in S_i} \cup \prod_{s_i \in S_i} \cup \prod_{s_i \in S_i})$ are of the form $(4)_3$. But

then, since $\prod_{x_3} \neq \phi$, it is clear that $\prod_{y_1} \cup \prod_{y_2} \cup \prod_{y_3} \cup \prod_{y_4} \cup \prod_{y_4} \cup \prod_{y_5} \cup$

We now consider the case when Tis of type B, C, F, or G.
Label the elements of Tas follows:

p lines
$$\frac{1}{\lambda_1} \frac{1}{\lambda_2} \frac{1}{\lambda_3} \frac{1}{\lambda_{s+1}} \frac{1}{\lambda_{r-1}} \frac{1}{\lambda_r}$$
(5)

where p=2 or 3 and $1 \le s < r$. Let S be the set of short roots of $\overline{\Pi}$ and let L be the set of long roots of $\overline{\Pi}$ i.e. $S = \{\lambda_1, \ldots, \lambda_s\}$ and $L = \{\lambda_{s+1}, \ldots, \lambda_r\}$. Put $\Pi_S = \bigcup_{\delta \in S} \Pi_{\delta}$, $\Pi_{SO} = \bigcup_{\delta \in S} \Pi_{o,\delta}$, $\Pi_{SO} = \bigcup_{\delta \in S} \Pi_{o,\delta}$. We have: $\underline{Lemma\ 7}$: $\underline{\Pi}_{LO}$ is *-connected, $\underline{\Pi}_{LO} \subseteq \underline{\Pi}_{o,\delta}$, and $\underline{\Pi}_{LO} = \underline{\Pi}_{o,\delta}$, and $\underline{\Pi}_{LO} \subseteq \underline{\Pi}_{o,\delta}$, and

<u>Proof:</u> By lemma 5 ((iii) and (iv)), $\prod_{o,\delta_{s+1}} \subseteq \prod_{o,\delta_s}$. Suppose for contradiction that \prod_{Lo} is not *-connected. By lemma 6 (applied to T = L), (\prod_L, \prod_{Lo}) is of the form (4). But $\prod_{Lo} \neq \varphi$, and hence $\prod_{o,\delta_{s+1}}$ is not *-connected. But $\prod_{o,\delta_{s+1}} = \prod_{o,\delta_s} \cap \prod_{o,\delta_{s+1}}$ and we have a contradiction by lemma 2(1). Therefore, \prod_{Lo} is *-connected.

By lemma 6, $\Pi_{L0} = \Pi_{o,\aleph_{s+1}} = \dots = \Pi_{c,\aleph_r}$. But $\Pi_{o,\aleph_{s+1}} \subseteq \Pi_{o,\aleph_s}$. Therefore, $\Pi_{L0} \subseteq \Pi_{o,\aleph_s}$. q.e.d.

We may now prove:

Prop. 5: Suppose Π is of type B, C, F, or G. Suppose $\Pi_s \neq \phi$.

Label the roots of Π as in (5). Put $\Pi_S = \Pi_{\delta_s} \cup \ldots \cup \Pi_{\delta_S}$. Then, $\Pi_s \subseteq \Pi_S$ and exactly one of the following holds:

- (a) s=1 or 2 and \prod_{α} is *-connected.
- (b) (Π_S, Π_o) is of the form (4).

<u>Proof</u>: $\Pi_o = \Pi_{So} \cup \Pi_{Lo}$ and, by lemma 7, $\Pi_{Lo} \subseteq \Pi_{o, V_s} \subseteq \Pi_{So}$.

Therefore, $\Pi_o = \Pi_{So} \subseteq \Pi_{S}$. The remaining conclusion follows from lemma 6 with T = S. q.e.d.

We also have:

Prop. 6: Same assumptions and notation as in Prop. 5. Then, exactly one of the following holds:

(a)
$$\prod_{o_1 Y_{c-1}} = \cdots = \prod_{o_1 Y_{c}} = \phi$$
.

(b) \prod is of type C_r $(r \ge 2)$, (\prod_S, \prod_o) is of the form (4), and \prod_{o,Y_s} is one of the *-components of \prod_{o,Y_s} .

Proof: By lemma 7, $\prod_{LO} \subseteq \prod_{o, \forall_s}$ and $\prod_{LO} = \prod_{o, \forall_{s+1}} = \cdots = \prod_{o, \forall_c}$. Thus, if $\prod_{o, \forall_c} = \phi$, (a) holds.

Suppose $\prod_{o,X_{s+1}} \neq \phi$. By lemma 7, $\prod_{o,X_r} \cap \prod_{o,X_s} \neq \phi$. Thus, by lemma 2(ii), r=s+1. By lemma 5 ((iii) and (iv)), p=2 and \prod_{o,X_s} is not *-connected. Then, by Prop. 5, (\prod_S, \prod_o) is of the form (4). Since $\prod_{o,X_{s+1}} = \prod_{o,X_s} \cap \prod_{o,X_{s+1}}$ is *-connected, (b) holds. q.e.d.

In case (a) of Prop. 6, we have more information:

<u>Prop. 7</u>: Same assumptions and notation as in Prop. 5. Suppose $\prod_{c, s_{s+1}} = \dots = \prod_{c, s_r} = \phi$. Then, $\bigcup_{s_{s+1}} \bigcup_{s_{s+1}} \bigcup_{$

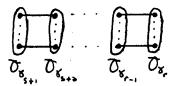

If
$$\prod$$
 is connected, then \prod_{S} is connected and (6) is connected.

If | is connected, then | is connected and (6) is connected.

Proof: The last statement is a consequence of the first statement.

Thus, we need only prove that $\mathcal{D}_{\xi_s} \cup \mathcal{T}_{\xi_{s+1}} \cup \ldots \cup \mathcal{T}_{\xi_r}$ is of the form (6).

Now, $\mathcal{T}_{LO} = \phi$ and hence (by lemma 6) $(\mathcal{T}_L, \mathcal{T}_{LO})$ is of the form

Thus, it suffices to show that $O_{S_s} \cup O_{S_{s+1}} = P \cap O_{S_{s+1}}$. Let P be a connected component of $\bigcap_{S_s} \cup O_{S_{s+1}} = P \cap O_{S_{s+1}} = P \cap O_{S_{s+1}}$. Let P be a connected component of $\bigcap_{S_s} \cup O_{S_{s+1}} = P \cap O_{S_{s+1}} =$

Suppose p=2. Then, $\overline{\mathcal{M}} \neq 2 \, \delta_s + \delta_{s+1}$. Thus, $\overline{\mathcal{M}} = \delta_s + \delta_{s+1}$ and hence P_s is a singleton $\{\alpha_s\}$, $m_{\alpha_s} = 1$, and $m_{\alpha_{s+1}} = 1$. Thus, $P_s \cup P_{s+1}$ is connected of type A_2 .

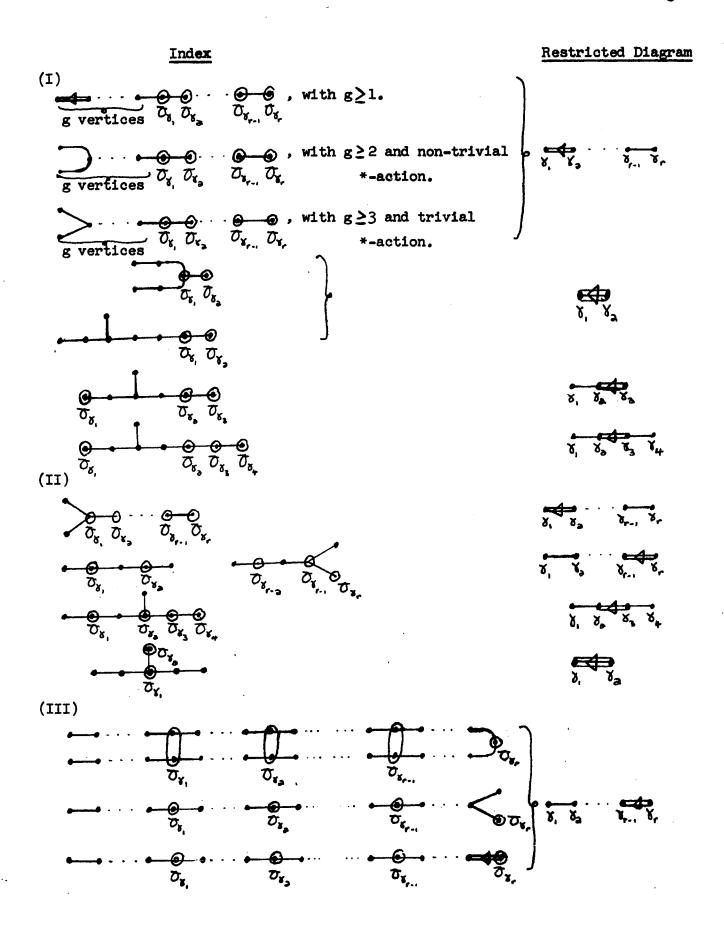

Suppose p=3. If $\overline{\mathcal{M}}=\S_s+\S_{s+1}$, we are done as above. Suppose for contradiction that $\overline{\mathcal{M}}\neq\S_s+\S_{s+1}$. But $\overline{\mathcal{M}}\neq3\S_s+\S_{s+1}$ and $\overline{\mathcal{M}}\neq3\S_s+2\S_{s+1}$. Therefore, $\overline{\mathcal{M}}=2\S_s+\S_{s+1}$. Then, $m_{\alpha_{s+1}}=1$ and $\sum_{\alpha\in P_s}m_{\alpha}\alpha=2$. Let \mathcal{M}_P be the dominant root for P. Write

 $\mathcal{H}_{P} = \sum_{\alpha \in P} n_{\alpha} \alpha . \text{ Now, for } \alpha_{s}, \alpha_{s}' \in P_{s}, \text{ there exists } \alpha \in A$ such that P = P and $\alpha_{s}'' = \alpha_{s}', \text{ and hence } n_{\alpha_{s}} = n_{\alpha_{s}'}. \text{ Thus, for }$ $\alpha_{s} \in P_{s}, \quad \overline{\mathcal{H}}_{P} = (\sum_{\alpha \in P_{s}} n_{\alpha}) \otimes_{s} + n_{\alpha_{s+1}} \alpha_{s+1} = |P_{s}| n_{\alpha_{s}} \otimes_{s} + n_{\alpha_{s+1}} \alpha_{s+1}.$ By lemma 2.4, $\overline{\mathcal{H}}_{P} = 3 \otimes_{s} + 2 \otimes_{s+1}. \text{ Thus, } |P_{s}| n_{\alpha_{s}} = 3 \text{ for } \alpha_{s} \in P_{s}.$ But since $\sum_{\alpha \in P_{s}} m_{\alpha} \alpha = 2, \quad |P_{s}| \leq 2. \text{ Thus, } P_{s} \text{ is a singleton}$ and $m_{\alpha_{s}} = 2. \text{ Thus, } P_{s} \cup P_{s+1} \text{ is of type } B_{2}. \text{ Therefore, } P \text{ is of the}$ form $\sum_{P_{s}} m_{\alpha} \alpha_{s} = n_{\alpha} \otimes_{s} n_{\alpha} \otimes_{s}$

Examples: We give here examples of the possible forms which indices may take under the assumptions of Prop. 5. For simplicity, we assume that \prod is connected (i.e. Zis central). One can actually show (using, for example, Table II of Tits [9]) that the examples given here are the only possible ones. Combining Prop. 5 and 6, it follows that there are only four cases to be considered, namely:

- (I) s=1 or 2, \prod_{o} is *-connected, and $\prod_{o,v_{o}} = \dots = \prod_{o,v_{o}} = \phi$.
- (II) (\prod_{S}, \prod_{o}) is of the form (4) and $\prod_{o, \delta_{S+1}} = \cdots = \prod_{o, \delta_{e}} = \phi$.
- (III) (\prod_{S}, \prod_{o}) is of the form (4), \prod is of type C_{r} $(r \ge 2)$, and $\prod_{S_{r}}$ is one of the two *-components of $\prod_{S_{r-1}}$.

We note that in cases (I) and (II) $\nabla_{\xi} \cup \prod_{\xi_{s+1}} \cup \cdots \cup \prod_{\xi_r}$ is of the form \bullet \bullet \bullet (by Prop. 7). The examples then are: $\nabla_{\xi_s} \nabla_{\xi_{s+1}} = \nabla_{\xi_{s+1}} \nabla_{$

To complete this chapter, we consider the case when $\overline{\Pi}$ is not reduced. There seems to be little one can say about the form of $(\overline{\Pi}, \overline{\Pi}_o)$ when $\overline{\Pi}$ has rank 1 and so we deal only with the case when rank $(\overline{\Pi}) > 1$.

Prop. 8: Suppose Π is not reduced and $r = rank(\Pi) > 1$. Label the roots of Π as follows:

Put $\Pi_S = \prod_{s_i} \cup ... \cup \prod_{s_{r-i}}$ and $\prod_{So} = \prod_{s_i \in S_i} \cup ... \cup \prod_{s_{r-i}}$. Then, exactly one of the following holds:

- (a) r=2 and Π_{So} is *-connected $\neq \phi$.
- (b) (Π_S, Π_{SO}) is of the form (4).

Moreover, if $\Pi_{So} \neq \phi$, we have $\Pi_{o, v_{r-1}} \cap \Pi_{o, x_r} \neq \phi$.

<u>Proof:</u> We prove the second statement first. Suppose $\prod_{So} \neq \Phi$ and suppose for contradiction that $\prod_{o, x_{i-1}} \cap \prod_{v_i = 0} \Phi$. Now, since $\prod_{So} \neq \Phi$ and $X_{i_1, \dots, N_{r-1}}$ are conjugate under \overline{W} , it follows that $\prod_{o, x_{r-1}} \neq \Phi$. Now, $\prod_{o, x_{r-1}} = \prod_{o, x_{r-1}} -\prod_{o, x_r} \Phi$ and hence, by lemma 3, $\prod_{o, x_{r-1}} \in \prod_{o, x_{r-1}} + x_r$. Operating on both sides of this inclusion with $\overline{W}_{x_{r-1}}$ we obtain $\prod_{c_1 x_{r-1}} \in \prod_{c_1 x_r} \Gamma_{c_1 x_r}$. Thus, $\prod_{o, x_{r-1}} = \prod_{o, x_r} \cap \prod_{o, x_{r-1}} \Phi$ and we have a contradiction.

We now prove the first statement. Suppose (b) does not hold. By lemma 6, \prod_{SO} is *-connected $\neq \phi$. But by the above, $\prod_{c,\delta_{r-1}} \bigcap_{s,\xi_r} \neq \phi \text{ and, by lemma 6, } \prod_{SO} = \prod_{c,\xi_r} = \cdots = \prod_{c,\delta_{r-1}} . \text{ Thus,}$ $\prod_{c,\xi_r} \bigcap_{s,\xi_r} \neq \phi \text{ . Therefore, by lemma 2(ii), } \forall_i + \forall_r \in \overline{\sum} \text{ . Thus, } r=2. \text{ q.e.d.}$

We have the following additional information about \prod_{c,a,b_r} : Prop. 9: Same assumptions and notation as in Prop. 8. Then, \prod_{c,a,b_r} is *-connected, $\prod_{c,a,b_r} \subseteq \prod_{c,b_{r-1}} \cap \prod_{c,b_r}$, and, if \prod_{So} is *-connected, $\prod_{c,a,b_r} \varphi$.

Proof: We apply lemma 5(iii) with $\mathcal{S} = \mathcal{S}_{r-1}$ and $\mathcal{S} = 2\mathcal{S}_r$. Thus, $\prod_{c, \mathbf{a}, \mathbf{v}_r} \subseteq \prod_{c, \mathbf{v}_{r-1}} \text{ and, if } \prod_{c, \mathbf{v}_{r-1}} \text{ is *-connected, } \prod_{c, \mathbf{v}_r} = \mathbf{\phi}$. Thus, $\prod_{c, \mathbf{a}, \mathbf{v}_r} \subseteq \prod_{c, \mathbf{v}_{r-1}} \cap \prod_{c, \mathbf{v}_r} \text{ and, since } \prod_{c, \mathbf{v}_{r-1}} \cap \prod_{c, \mathbf{v}_r} \text{ is *-connected, } \prod_{c, \mathbf{v}_{r-1}} \text{ is *-connected and hence}$ *-connected. If $\prod_{\mathbf{v} \in \mathbf{v}_r} \text{ is *-connected, } \prod_{c, \mathbf{v}_{r-1}} \text{ is *-connected and hence}$ $\prod_{c, \mathbf{v}_r} = \mathbf{\phi}$. q.e.d.

Corollary: Same assumptions and notation as in Prop. 8. Then, $(\prod_{o_i \aleph_{r-1}} \cap \prod_{o_i \aleph_r})^{\widetilde{W}_{\aleph_r}} = \prod_{o_i \aleph_{r-1}} \cap \prod_{o_i \aleph_r} \text{ and } \prod_{So} \text{ is stabilized by } \overline{W}.$

<u>Proof:</u> It suffices to prove the first statement since $\overline{W}_{S_r}, \dots, \overline{W}_{S_{r-1}}$ stabilize $\prod_{S_O} \cap \prod_{a_i S_r} \cap \prod_{a_i S_{r-1}} \cap \prod_{a_i S_r}$

If $\prod_{e, \mathbf{a}, \xi_e} \neq \Phi$, we have $\prod_{e, \mathbf{a}, \xi_e} \prod_{e, \xi_e, \xi_e} \mathbb{I}$ by Prop. 9 (since both sets are *-components of \prod_e) and the statement is immediate. Suppose $\prod_{e, \mathbf{a}, \xi_e} = \Phi$. Then, by Prop. 2.7, $\overline{w}_{\xi_e} = \overline{w}_{\mathbf{a}, \xi_e}$ fixes the elements of \prod_e . q.e.d.

If (a) holds in Prop. 8, we also have:

Prop. 10: Same assumptions and notation as in Prop. 8. If (a) holds in Prop. 8 and Π is connected, then Π_{χ_i} is connected.

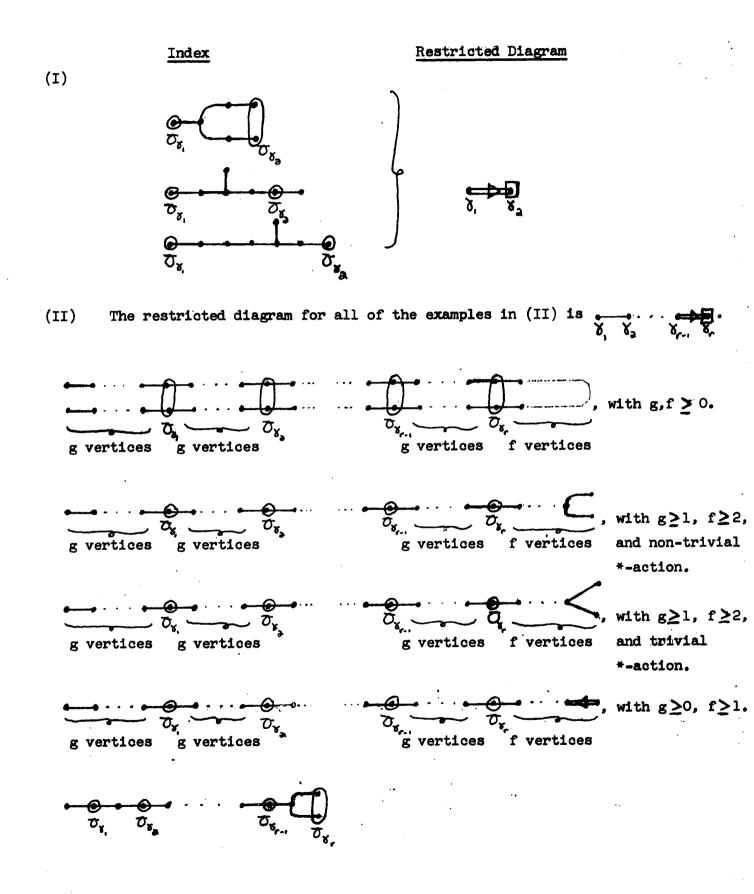

Proof: It suffices to show that D_{χ_i} is a singleton. Suppose the contrary. Let μ_{Π} be the dominant root for Π . By lemma 2.4, $\overline{\mu_{\Pi}} = 2\chi_i + 2\chi_i$. Hence, D_{χ_i} is a doubleton $\{\alpha_i, \alpha_i\}$. Now, by

Prop. 9, $\prod_{c_1 \ge c_2} = \phi$. Thus, $\prod_{c_1 \ge c_1 + 3 \le a} = \prod_{c_1 \ge c_2} \frac{\overline{W}_{S_1}}{1} = \phi$. Therefore, $\mathcal{M}_{\Pi} - \beta \notin \sum$ for $\beta \in \prod_{o}$. But since $2\delta_i + \delta_j \notin \sum_{i} \mathcal{M}_{\Pi} - \alpha_i \notin \sum_{i} \sum_{i} \mathcal{M}_{\Pi} - \alpha_i + \alpha_i +$

Examples: We give here examples of the possible forms which indices may take under the assumptions of Prop. 8. We assume then that $\overline{\Pi}$ is not reduced and has rank r > 1. For simplicity, we assume $\overline{\Pi}$ is connected. As in the previous set of examples, one can show that the examples given here are the only possible ones. By Prop. 8, it follows that there are only two cases to be considered, namely:

- (I) r=2 and Π_{So} is *-connected $\neq \phi$.
- (II) (Π_S, Π_{SO}) is of the form (4).

The examples then are:

Chapter 4

The Anisotropic Kernel

In this chapter, we interpret the propositions of Chapter 3 to give us information about the anisotropic kernel. We will assume throughout the chapter that \mathcal{L} is a simple Lie algebra over \mathcal{R} and that \mathcal{I} , \mathcal{K}

We begin by defining some ideals of $[\mathcal{L}_o$, $\mathcal{L}_o]$ which will be of particular interest when $\overline{\mathcal{M}}$ is not reduced.

Suppose $\delta \in \mathbb{Z}$. If all of the elements of \mathbb{Z} have the same length, we put $\mathcal{H}_{\delta} = (0)$. Otherwise, we define

$$\mathcal{H}_{\gamma} = \bigcap_{\xi \in \mathbb{Z}} \mathcal{O}_{\xi} \cap [\mathcal{L}, \mathcal{L}_{\varepsilon}].$$

$$(\xi, \xi) \neq (\xi, \xi)$$

Now, \mathcal{O}_{δ} is an ideal of \mathcal{J}_{δ} and hence $\mathcal{O}_{\delta} \cap [\mathcal{J}_{\delta}, \mathcal{J}_{\delta}]$ is an ideal of $[\mathcal{J}_{\delta}, \mathcal{J}_{\delta}]$, $\delta \in \overline{\Sigma}$. Thus, \mathcal{N}_{δ} is an ideal of $[\mathcal{J}_{\delta}, \mathcal{J}_{\delta}]$. It should also be noted that \mathcal{N}_{δ} depends only on the length of δ .

i.e. If $\delta \in \overline{\Sigma}$ such that $(\delta, \delta) = (\delta, \delta)$, then $\mathcal{N}_{\delta} = \mathcal{N}_{\delta}$.

Prop. 1: Let $\emptyset \in \overline{\Pi}$ and suppose m \emptyset is of maximal length in $\overline{\Sigma}$ for some positive integer m. Then:

- (i) If Π is reduced, $\Pi_{\chi} = (0)$.
- (ii) If $\overline{\Pi}$ is not reduced and has rank 1, then $\overline{\Pi} = \{Y\}$ and $[\mathcal{L}_o, \mathcal{L}_o] = \mathcal{L}_{oax} \oplus \mathcal{N}_x$.
- (iii) If \overline{N} is not reduced and has rank > 1, then $\delta = \delta_r$ and $J_{o,\delta_r} = (J_{o,\delta_{r-1}} \cap J_{o,\delta_r}) \oplus \mathcal{N}_{\delta_r}$, where the roots of \overline{N} are labelled as follows:

<u>Proof</u>: (i) Suppose $\overline{\Pi}$ is reduced. We may assume $[\mathcal{L}, \mathcal{L}_o] \neq (0)$ and the elements of T take on more than one length. Hence, the assumptions of Prop. 3.5 are satisfied. We use the notation of that proposition. Then, $\forall = \forall$; for some $j \in \{s+1,...,r\}$ and $\mathcal{H}_{\mathcal{S}} \subseteq \bigcap_{i=1}^{n} \mathcal{H}_{\mathcal{S}} \cap [\mathcal{L}_{\mathcal{S}}, \mathcal{L}_{\mathcal{S}}].$ But $\prod_{i=1}^{n} \prod_{j \in \mathcal{S}} \mathcal{U} \dots \mathcal{U} \prod_{i \in \mathcal{S}}$ and hence every simple summand of [\mathcal{L}_{o} , \mathcal{L}_{o}] acts non-trivially on one of $\mathcal{L}_{\xi_1}, \ldots, \mathcal{L}_{\xi_n}$. Thus, $\bigcap_{i=1}^n \mathcal{O}_{\xi_n} \cap [\mathcal{L}_{i}, \mathcal{L}_{i}] = (0)$ and hence $\mathcal{N}_{\xi_n} = (0)$. (11) Suppose $\overline{\Pi}$ is not reduced and has rank 1. Then, $\overline{\Pi} = \{ \gamma \}$ and $\mathcal{H}_{x} = \mathcal{O}_{2x} \cap \mathcal{O}_{2x} \cap [\mathcal{L}_{o}, \mathcal{L}_{o}]$. Since $\mathcal{O}_{2x} = \mathcal{O}_{2x}$ (by Prop. 2.2), we have $\mathcal{N}_{\lambda} = \mathcal{O}_{ax} \cap [\mathcal{L}_{a}, \mathcal{L}_{a}]$. But $\mathcal{L}_{a} = \mathcal{O}_{ax} \oplus [\mathcal{L}_{ax}, \mathcal{L}_{ax}]$ (by Prop. 2.2) and both summands are ideals of \mathcal{L}_o . Thus, $[\mathcal{L}_o,\mathcal{L}_o] = (\sigma_{a\times n}[\mathcal{L}_o,\mathcal{L}_o])_{\oplus}([\mathcal{L}_{a\times n}\mathcal{L}_{a\times n}]\cap[\mathcal{L}_o,\mathcal{L}_o]) = \mathcal{N}_{x}\oplus\mathcal{L}_{a\times n}$ (111) Suppose Π is not reduced and has rank >1. We use the notation of Prop. 3.8. Then, $Y = Y_r$ and $\Pi_{X} \subseteq \bigcap_{i=1}^{n} \Omega_{X_i} \cap [\mathcal{L}_i, \mathcal{L}_o]$. Now, every simple summand of $[\mathcal{J}_o,\mathcal{L}_o]$ must act non-trivially on one of $\mathcal{I}_{s_r}, \ldots, \mathcal{I}_{s_r}$ (since $\mathcal{T}_{s_r} = \mathcal{T}_{s_s} \cup \ldots \cup \mathcal{T}_{s_r}$). But every simple summand of \mathcal{N}_{y} acts trivially on $\mathcal{I}_{y_{i}}$, i=1,...,r-1. Thus, $\mathcal{N}_{y_{i}} \subseteq \mathcal{L}_{o, y_{i}}$ and $(f_{x_1} \cap f_{x_2}) \cap \mathcal{H}_{x_3} = \phi$ (by the Corollary to Prop. 2.2). To complete the proof of (iii), it suffices to show that if $\mathcal{L}_{o,i}$ is a simple summand of J_{o,v_c} such that $J_{o,v} \notin \mathcal{N}_{\delta_c}$, then $\mathcal{J}_{o_1} \in \mathcal{J}_{o_1 v_{c-1}} \cap \mathcal{J}_{o_1 v_{c}}$. Let \mathcal{J}_{o_1} be such a simple summand and let $\Pi_{e,i}$ be the corresponding *-component of $\Pi_{e,k}$. Since $\mathcal{L}_{e,i} \notin \mathcal{L}_{k}$, \mathcal{J}_{o} , acts non-trivially on \mathcal{J}_{δ} for some $\delta \in \sum$ such that $(\delta, \delta) \neq (\delta, \delta)$. Then, $\Pi_{a_1} \subseteq \Pi_{a_1} \subseteq \mathbb{F}$. But, since $(\delta, \delta) \neq (\delta_r, \delta_r)$, there exists $\overline{\mathbf{w}} \in \overline{\mathcal{W}}$ such that $\delta = (2 \delta_r)^{\overline{W}}$ or $\delta = (\gamma_{r,i})^{\overline{W}}$. Thus, $\Pi_{o,i} \subseteq \Pi_{o, ak}^{\overline{W}}$ or $\Pi_{0,1} \subseteq \Pi_{0,3}^{\overline{W}}$. But, by Prop. 3.9, $\Pi_{0,3,5} \subseteq \Pi_{0,3}$. Thus,

 $\Pi_{o,i} \subseteq \Pi_{o,x_{r-i}} \stackrel{\overline{W}}{\cdot}$ But, by the Corollary to Prop. 3.9, $\Pi_{So}^{\overline{W}} = \Pi_{So}^{\bullet}$.

Thus, $\Pi_{o,i} \subseteq \Pi_{So}^{\bullet}$ But $\Pi_{o,i} \subseteq \Pi_{o,x_r}$ and hence $\Pi_{o,i} \subseteq \Pi_{So} \cap \Pi_{o,x_r} = \Pi_{o,x_{r-i}} \cap \Pi_{o,x_r}$. Thus, $J_{o,i} \subseteq J_{o,x_{r-i}} \cap J_{o,x_r}$. q.e.d.

In the remainder of this chapter, we denote by G the group of automorphisms φ of \mathcal{L} such that $\mathcal{I}^{\varphi} = \mathcal{I}$ and φ is a product of elements of $\{\exp(\operatorname{ad}_{\mathcal{L}}(X))\colon X\in\mathcal{L},\operatorname{ad}_{\mathcal{L}}(X) \text{ nilpotent}\}$. The elements of G stabilize \mathcal{I}_{\circ} and hence stabilize center(\mathcal{I}_{\circ}) and permute the simple summands of $[\mathcal{I}_{\circ},\mathcal{I}_{\circ}]$. As we have remarked in Chapter 1, for $\overline{\mathbb{W}}\in\overline{\mathbb{W}}$ there exists $\varphi\in G$ such that $\mathcal{I}_{\chi}^{\varphi}=\mathcal{I}_{\chi}^{\overline{\mathbb{W}}}$ for $\chi\in\overline{\mathcal{I}}$. We are interested then in how such an autormorphism φ permutes the simple summands of $[\mathcal{I}_{\circ},\mathcal{I}_{\circ}]$.

Prop. 2: Let $\overline{\mathbb{W}}\in\overline{\mathbb{W}}$. Suppose $q\in G$ such that $\mathcal{J}_{K}^{q}=\mathcal{J}_{N}^{\overline{W}}$ for $X\in\overline{\mathbb{D}}$. Let $\mathcal{J}_{0,1},\ldots,\mathcal{J}_{0,L}$ be the simple summands of $[\mathcal{J}_{0},\mathcal{J}_{0}]$. Let $\mathcal{J}_{0,1},\ldots,\mathcal{J}_{0,L}$ (resp.) be the corresponding *-components of \mathcal{J}_{0} . For $i\in\{1,\ldots,t\}$, define $i\in\{1,\ldots,t\}$ by $\mathcal{J}_{0,L}^{q}=\mathcal{J}_{0,L}^{q}$. Suppose $j\in\{1,\ldots,t\}$. Then, $\mathcal{J}_{0,j}^{\overline{W}}=\mathcal{J}_{0,j}^{q}$. Moreover, if $(\mathcal{J}_{0,L}^{q})^{q}=\mathcal{J}_{0,L}^{q}$ and $(q\mathcal{J}_{0,j}^{q})^{*}$ maps $\mathcal{J}_{0,j}^{q}$ onto $\mathcal{J}_{0,j}^{q}$, then $(q\mathcal{J}_{0,j}^{q})^{*}=\overline{\mathbb{W}}\mathcal{J}_{0,j}^{q}$. Proof: Suppose $i\in\{1,\ldots,t\}$. Let G_{L}^{q} be the group of automorphisms of $(\mathcal{J}_{0,L}^{q})_{K}^{q}$ which are products of elements of $\{\exp(\mathrm{ad}_{\mathcal{J}_{0,L}^{q})_{K}^{q}}(X): X\in(\mathcal{J}_{0,L}^{q})_{K}^{q}, \mathrm{ad}_{\mathcal{J}_{0,L}^{q})_{K}^{q}}(X): X\in(\mathcal{J}_{0,L}^{q})_{K}^{q}, \mathrm{ad}_{\mathcal{J}_{0,L}^{q}}(X): X\in(\mathcal{J}_{0,L}^{q})_{K}^{q}$ is nilpotent. Thus, for such X, $\mathrm{exp}(\mathrm{ad}_{\mathcal{J}_{0,L}^{q})_{K}^{q}}(X): X\in(\mathcal{J}_{0,L}^{q})_{K}^{q}$ extends to the automorphism $\mathrm{exp}(\mathrm{ad}_{\mathcal{J}_{0,L}^{q}}(X): X): X\in(\mathcal{J}_{0,L}^{q})_{K}^{q}$. Hence, we may

regard the elements of G_i as automorphisms of \mathcal{L}_K which fix the elements of (center(\mathcal{L}_o))_K and fix the elements of the simple summands of [\mathcal{L}_o , \mathcal{L}_o] other than \mathcal{L}_i .

Suppose $i \in \{1, ..., t\}$. Then, there exists $\forall_i \in G_i$ such that $(\mathcal{L}_{o,i} \cap \mathcal{L}_{o})_K^{\varphi \psi_i} = (\mathcal{L}_{o,\tau} \cap \mathcal{L}_{o})_K$ and $(\varphi \psi_i)(\mathcal{L}_{o,i})_K^{\varphi})^*$ maps $\Pi_{o,i}$ onto $\Pi_{e,\tau}$. Moreover, if $(\mathcal{L}_{o,i} \cap \mathcal{L}_{o})^{\varphi} = \mathcal{L}_{o,\tau} \cap \mathcal{L}_{o}$ and $(\varphi \mid \mathcal{L}_{o,i})^*$ maps $\Pi_{o,i}$ onto $\Pi_{e,\tau}$, then we may choose $\psi_i = 1$.

Put $\Psi = \Psi_i \dots \Psi_t$. Then, Ψ fixes the elements of (center(\mathcal{J}_o))_K and stabilizes $(\mathcal{J}_o)_k$, i=1,...,t. Moreover,

$$\begin{split} &([\mathcal{L}_{o},\mathcal{L}_{o}]\cap\mathcal{L}_{o})_{K}^{\varphi\Psi} = ([\mathcal{L}_{o},\mathcal{L}_{o}]\cap\mathcal{L}_{o})_{K} \text{ and } ((\varphi\Psi)[[\mathcal{L}_{o},\mathcal{L}_{o}]_{K})^{*}\\ \text{maps } &\prod_{o} \text{ onto } &\prod_{o}. \text{ But } \varphi \text{ stabilizes center}(\mathcal{L}_{o}). \text{ Thus,}\\ &\mathcal{L}_{K}^{\varphi\Psi} = \mathcal{L}_{K}, &\prod_{o}(\varphi\Psi)^{*} = &\prod_{o}, \text{ and } (\varphi\Psi)^{*}| \mathcal{K}_{\Sigma} = \forall |\mathcal{K}_{\Sigma}. \text{ But}\\ &(\varphi\Psi)^{*} \in \mathcal{N} \text{ and hence } (\varphi\Psi)^{*} = \forall \text{ (regarding } \forall \text{ as an element of } \mathcal{N}). \end{split}$$

Suppose $j \in \{1, \dots, t \}$. Then, $(\mathcal{I}_{o,j})_K^{\varphi \psi} = (\mathcal{I}_{o,j})_K$ and hence, since $(\varphi \psi)^* = \overline{\psi}$, $\Pi_{o,j}^{\overline{\psi}} = \Pi_{o,j}^{\overline{\psi}}$. Suppose $(\mathcal{I}_{o,j} \cap \mathcal{I}_{o,j})^{\varphi} = \mathcal{I}_{o,j}^{\varphi} \cap \mathcal{I}_{o,j}^{\varphi}$ and $(\varphi \mid \mathcal{I}_{o,j})^*$ maps $\Pi_{o,j}$ onto $\Pi_{o,j}^{\varphi}$. Then, $\Psi_j = 1$. Hence, $(\varphi \mid \mathcal{I}_{o,j})^* = (\varphi \Psi_j \mid \mathcal{I}_{o,j})^* = (\varphi \Psi \mid \mathcal{I}_{o,j})^* = \overline{\psi} \mid \Pi_{o,j}^{\varphi}$. q.e.d.

In view of Prop. 2, we have the following interpretation of Prop. 3.2:

Theorem 1: Suppose $\overline{\Pi}$ is reduced. Then, the simple summands of $[\mathcal{L}_o,\mathcal{L}_o]$ are conjugate under G. i.e. If \mathcal{L}_c , and $\mathcal{L}_{c,a}$ are simple summands of $[\mathcal{L}_o,\mathcal{L}_o]$, then there exists $q\in G$ such that $\mathcal{L}_{c,a}=\mathcal{L}_{c,a}$. Proof: Let $\Pi_{c,a}$ and $\Pi_{c,a}$ be the *-components of Π_c corresponding to $\mathcal{L}_{c,a}$ and $\mathcal{L}_{c,a}$ respectively. By Prop. 3.2, we may choose $\overline{w}\in \overline{W}$ such that $\Pi_{c,a}=\Pi_{c,a}$. Choose $q\in G$ such that $\mathcal{L}_{g}=\mathcal{L}_{g}\overline{w}$ for $g\in S$.

By Prop. 2, the *-component of \prod_{o} corresponding to $\mathcal{L}_{o,o}^{\varphi}$ is $\prod_{o,a}^{\overline{W}} = \prod_{o,i}$. Therefore, $\mathcal{L}_{o,a}^{\varphi} = \mathcal{L}_{o,i}$. q.e.d.

We now prove three theorems about the structure of $[J_o, J_o]$ and its action on certain restricted root spaces. If $[J_o, J_o] \neq (0)$, we cannot have \prod of type D or E and hence we are interested only in the following three cases:

- (I) $\overline{\prod}$ is of type A_r $(r \ge 1)$.
- (II) \prod is of type B_r $(r \ge 3)$, C_r $(r \ge 2)$, F₄, or G₂.
- (III) I is not reduced.

The three theorems will treat these three cases separately and are "rational" interpretations of Prop. 3.3, 3.5, 3.6, 3.8 and 3.9.

Theorem 2: Suppose $\overline{\prod}$ is of type A_r $(r \ge 1)$ and $[\mathcal{L}, \mathcal{L}] \ne (0)$. Then, $[\mathcal{L}, \mathcal{L}]$ acts non-trivially on \mathcal{L}_8 for all $\emptyset \in \overline{\Sigma}$ and exactly one of the following holds:

- (a) $[J_o, J_o]$ is simple and r=1 or 2.
- (b) $[\mathcal{L}, \mathcal{L}]$ is the direct sum of r+l isomorphic simple algebras.

Proof: Now, $\Pi_{o,v} \neq \phi$ for some $V \in \Sigma$. But all elements of Σ are conjugate under W. Therefore, $\Pi_{o,v} \neq \phi$ for all $V \in \Sigma$. By the Corollary to Prop. 2.2, the first statement follows. By Prop. 3.3, either (Π, Π_o) is of the form (4) or Π_o is *-connected and r=1 or 2. In the latter case, (a) holds. If (Π, Π_o) is of the form (4), $[\mathcal{J}_v, \mathcal{J}_o]$ has r+1 simple summands which (by Thm. 1) are isomorphic. q.e.d.

Theorem 3: Suppose $\overline{\prod}$ is of type B_r $(r \ge 3)$, C_r $(r \ge 2)$, F_4 , or G_2 . Suppose $[\mathcal{L}, \mathcal{L}] \neq (0)$. Label the roots of $\overline{\Pi}$ as follows:

b lines

where p=2 or 3 and $1 \le s < r$. Then, exactly one of the following holds:

- (a) $[\mathcal{J}_{a}, \mathcal{J}_{a}]$ is simple and s=1 or s=2.
- (b) $[\mathcal{J}_{o},\mathcal{J}_{o}]$ is the direct sum of s+1 isomorphic simple algebras. Moreover, the adjoint action of $[\mathcal{L}, \mathcal{L}_o]$ on $\mathcal{L}_{\chi_1}, \ldots, \mathcal{L}_{\chi_s}$ is trivial unless (b) holds and $\overline{11}$ is of type C_r $(r \ge 2)$, in which case at most one of the simple summands of $[\mathcal{A}_o,\mathcal{A}_o]$ acts non-trivially on $\mathcal{Z}_{\delta_{-}}$.

Proof: We use the notation of Prop. 3.5. Since (by Thm. 1) the simple summands of $[\mathcal{L},\mathcal{L}]$ are isomorphic, the first statement of the theorem follows immediately from Prop. 3.5.

Suppose now that $[J_o,J_o]$ acts non-trivially on J_{s_i} for some $j \in \{s+1, ..., r\}$. Let $\mathcal{L}_{i,j}, ..., \mathcal{L}_{i,t}$ be the simple summands of $[\mathcal{J}_o,\mathcal{J}_o]$ which act non-trivially on \mathcal{J}_{χ_i} . Let \mathcal{T}_{c_i} , ..., $\mathcal{T}_{c_i,\pm}$ (resp.) be the corresponding *-components of \mathcal{N}_o . By the Corollary to Prop. 2.2, we have $\Pi_{e_1}, \ldots, \Pi_{e_r t} \subseteq \Pi_{e_r t}$. In particular, $\Pi_{e,b} \neq \phi$. By Prop. 3.6, $\overline{\Pi}$ is of type $C_r (r \geq 2)$, (Π_S, Π_e) is of the form (4), and $\prod_{e,k}$ is one of the two *-components of $\prod_{e,k}$. Hence, r = j = s+1 and t = 1. Since (\prod_{S}, \prod_{o}) is of the form (4), (b) holds. q.e.d.

In considering the final case (\prod not reduced), we assume in this chapter (as in the last) that \prod has rank r>1.

Theorem 4: Suppose $\overline{\Pi}$ is not reduced and has rank r > 1. Label the roots of $\overline{\Pi}$ as follows: $\underbrace{}_{\chi_1, \chi_2} \cdots \underbrace{}_{\chi_{r-1}, \chi_r} \underbrace{}_{\chi_{r-1}, \chi_r} \cdots \underbrace{}_{\chi_{r-1}, \chi_r} \underbrace{}_{\chi_{r-1}, \chi_r} \cdots \underbrace{}_{\chi_{r-1}, \chi_r} \underbrace{}_{\chi_{r-1}, \chi_r} \cdots \underbrace{}_{\chi_{r-1}, \chi_r} \cdots$

- (a) r=2, $\mathcal{M}_o \neq (0)$, and $[\mathcal{J}_o, \mathcal{J}_o] = \mathcal{J}_{o,\delta_c}$.
- (b) $[J_o, J_o]$ is the direct sum of J_{c,δ_c} and r-1 ideals of $[J_o, J_o]$ isomorphic to \mathcal{M}_o .

Proof: Put $\Pi_{S} = \Pi_{\delta_{1}} \cup ... \cup \Pi_{\delta_{r-1}}$ and $\Pi_{SO} = \Pi_{o,\delta_{r}} \cup ... \cup \Pi_{o,\delta_{r-1}}$.

By Prop. 1 (iii), $J_{o,\delta_{r}} = \mathcal{M}_{o} \oplus \mathcal{N}_{\delta_{r}}$. Since $\Pi_{o,\delta_{r-1}} \cap \Pi_{c,\delta_{r}}$ is *-connected, \mathcal{M}_{o} is simple or (0).

By Prop. 3.8, either r=2 and Π_{SO} is *-connected $\neq \phi$ or (Π_S, Π_{SO}) is of the form (4).

Suppose r=2 and Π_{SO} is *-connected $\neq \Phi$. By Prop. 3.8, $\Pi_{e,\chi_{r-1}} \cap \Pi_{e,\chi_r} \neq \Phi.$ Therefore, $M_o \neq (0)$. Since Π_{SO} is *-connected and $\Pi_{e,\chi_{r-1}} \cap \Pi_{e,\chi_r} \subseteq \Pi_{SO}$, $\Pi_{e,\chi_r} \cap \Pi_{e,\chi_r} = \Pi_{SO}$. But $\Pi_o = \Pi_{SO} \cup \Pi_{e,\chi_r}$. Therefore, $\Pi_o = \Pi_{SO} \cup \Pi_{e,\chi_r}$.

Suppose (Π_S, Π_{SO}) is of the form (4). If $\Pi_{SO} = \phi$, then $\Pi_{o,\delta_r} \cap \Pi_{o,\delta_r} = \phi$ and $\Pi_o = \Pi_{o,\delta_r}$. Therefore, if $\Pi_{SO} = \phi$, $M_o = (0)$ and $[\mathcal{J}_o, \mathcal{J}_o] = \mathcal{J}_{o,\delta_r}$. Thus, (b) helds in this case. Suppose $\Pi_{SO} \neq \phi$. By Prop. 3.8, $\Pi_{o,\delta_r} \cap \Pi_{o,\delta_r} \neq \phi$. Since $\Pi_{o,\delta_r} \cap \Pi_{o,\delta_r}$ is *-connected and (Π_S, Π_{SO}) is of the form (4), it is immediate that (b) holds provided we know that the simple summands corresponding

to *-components of Π_{SO} are isomorphic. This follows from Prop. 2 if the *-components of Π_{SO} are conjugate under $\overline{\mathcal{W}}$. But $\overline{\mathcal{W}}_{S_i}$ interchanges the two *-components of Π_{\bullet,V_i} , i=1,...,r-1, and we are done. q.e.d.

Under the assumptions of Theorem 4, we may interpret Prop. 3.9 to obtain information about the action of $[\mathcal{L}, \mathcal{J}_o]$ on $\mathcal{J}_{\lambda k_r}$. In particular, if (a) holds, this action is trivial. On the other hand, if (b) holds, all simple summands of $[\mathcal{L}, \mathcal{L}_o]$ which act non-trivially on $\mathcal{L}_{\lambda k_r}$ are contained in \mathcal{M}_o (and hence there is at most one such summand). We do not need this information and so we omit the verification.

Chapter 5

A Rational Isomorphism Theorem

In this chapter, we apply the propositions of Chapter 3 to prove a rational isomorphism theorem for central simple algebras over R. Throughout the chapter, L is a simple algebra over R with maximal split toral subalgebra \mathcal{J} . \overline{L} is the restricted root system for (L,\mathcal{J}) and \overline{L} is a fundamental system for \overline{L} . In the isomorphism theorem and the preparatory lemmas, L is a second simple algebra over R and R, and R are chosen as above. We assume R is a Galois splitting extension for both (L,\mathcal{J}) and (L',\mathcal{J}') i.e. R splits R for some Cartan subalgebra R of R containing R and R splits R for some Cartan subalgebra R of R containing R and R begin to R some R subalgebra R of R containing R and R begin to R splits R for some Cartan subalgebra R of R containing R and R begin to R splits R for some Cartan subalgebra R of R containing R and R begin to R splits R for some Cartan subalgebra R of R containing R and R begin to R splits R for some Cartan subalgebra R of R containing R we put R and R begin the subalgebra R of R containing R we

Our isomorphism theorem is stated without reference to a Cartan subalgebra of \mathcal{L} or to the data \prod_{o} , \sum_{o} , \prod_{o} , and \sum_{o} discussed in earlier chapters. Thus, in the proof of this theorem, we are free to choose for our convenience any Cartan subalgebra \mathcal{L} which contains \mathcal{L} and is split by K. Once such an \mathcal{L} is chosen, we are free to choose any fundamental system \prod_{o} for the roots of $([\mathcal{L}_{o},\mathcal{L}_{o}]_{K},(\mathcal{L}\cap[\mathcal{L}_{o},\mathcal{L}_{\sigma}])_{K})$. \sum_{o} , \prod_{o} , and \sum_{o} are then uniquely determined. For simplicity, we simply say that we have chosen \mathcal{L} and \prod_{o} .

Suppose for the moment that $J_{0,1}, \ldots, J_{0,\pm}$ are the simple summands of $[J_0, J_0]$. Suppose that $J_{0,1}, \ldots, J_{0,\pm}$ are Cartan subalgebras of $J_{0,1}, \ldots, J_{0,\pm}$ respectively which are split by K. Then, there is a

unique choice of f such that $f \cap f_{i,i} = f_{o,i}$, $i=1,\ldots t$, namely center $(f_o) \oplus f_{o,i} \oplus \ldots \oplus f_{o,t}$. We say that f is the Cartan subalgebra determined by $f_{o,i},\ldots,f_{o,t}$. Conversely, of course, if f is chosen, $f \cap f_{o,i}$ is a Cartan subalgebra of $f_{o,i}$ split by f.

Suppose now that $\mathcal{J}_{o,i}$ is a fundamental system for the roots of $((\mathcal{J}_{o,i})_K, (\mathcal{J}_{o,i} \cap \mathcal{J}_{o})_K)$, $i=1,\ldots,t$. Then, there exists a unique choice of \mathcal{T}_o such that $\mathcal{T}_{o,i}$ is the *-component of \mathcal{T}_o corresponding to $\mathcal{J}_{o,i}$, $i=1,\ldots,t$. We say that \mathcal{T}_o is determined by $\mathcal{T}_{o,i}$, $\ldots,\mathcal{T}_{o,i}$.

Our method of proof of the rational isomorphism theorem involves applications of Thm. 1.2. Thus, we are interested in the problem of extending certain *-isomorphisms. We now discuss this problem in certain particular situations.

Suppose that T is a subset of \overline{T} of type A_q $(q \ge 1)$. Label the roots of T as follows: \emptyset_q \emptyset_{q-1} \emptyset_q . Define

$$\mathcal{L}_{To} = \sum_{i=1}^{n} \mathcal{I}_{i, x_{i}}.$$

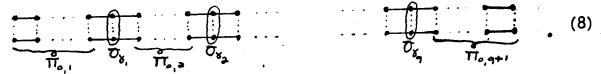

For any choice of \mathcal{L} and $\mathcal{T}_{\mathbb{T}}$, define $\mathcal{T}_{\mathbb{T}}$ and $\mathcal{T}_{\mathbb{T}_{\mathcal{T}}}$ as in lemma 3.6. Let $\overline{\mathbb{W}}_{\mathbb{T}}$ be the subgroup of $\overline{\mathbb{W}}$ generated by $\{\overline{\mathbb{W}}_{\mathbb{T}}\}_{\mathbb{T}\in\mathbb{T}}$.

We assume to begin with that \mathcal{L}_{To} is non-zero and not simple. By lemma 3.6, it follows that for any J_{a} and \mathcal{T}_{o} , $(\mathcal{T}_{T}, \mathcal{T}_{To})$ is of the form (4). Thus, \mathcal{L}_{To} is the sum of q+1 simple summands which we may label J_{o} , ..., $J_{o,q+1}$ in such a way that

$$\mathcal{J}_{o,y_i} = \mathcal{J}_{o,j} \bullet \mathcal{J}_{o,j+1} , \qquad (7)$$

j=1,...,q. (If q=1, this labelling may be accomplished in two ways but at any rate we assume such a labelling is given and fixed.)

For any choice of $\mathcal{L}_{o,i}$ and $\mathcal{L}_{o,i}$, let $\mathcal{L}_{o,i}$ be the *-component of $\mathcal{L}_{o,i}$ corresponding to $\mathcal{L}_{o,i}$, i=1,...,q+1, in which case we have the following diagram for $(\mathcal{L}_{\mathcal{L}},\mathcal{L}_{\mathcal{L}},\mathcal{L}_{\mathcal{L}})$:

Now, $\overline{\mathbb{W}}_T$ is isomorphic to the full permutation group of $\{1,\ldots,q+1\}$ in such a way that if $\mathbb{X} \longrightarrow \overline{\mathbb{W}}_{\mathcal{X}}$ denotes the isomorphism, then $\overline{\mathbb{W}}_{(j,j+1)} = \overline{\mathbb{W}}_{\delta_j}$, $j=1,\ldots,q$. But, for any $\int_{\mathbb{C}}$ and $\overline{\mathbb{W}}_{\delta_j}$, $\overline{\mathbb{W}}_{\delta_j}$ fixes the elements of $\overline{\mathbb{W}}_{TO} - \overline{\mathbb{W}}_{\delta_j,\delta_j}$ and $\overline{\mathbb{W}}_{\delta_j,\delta_j} = (i_{\overline{\mathbb{W}}_{\delta_j}}, i_{-1}, i_$

where in this diagram $\overline{\Pi}_{0,i}$ and $\overline{\Pi}_{0,j}$ are isolated from (8). Suppose \overline{W}_{-} is the unique element of \overline{W}_{T} such that $T^{\overline{W}_{-}} = -T$. It is then easy to see that \overline{W}_{-} is the product of the $[\frac{q+1}{2}]$ elements $\overline{W}_{(1,q+1)}, \dots, \overline{W}_{(\lfloor \frac{q+1}{2} \rfloor, q+2-\lfloor \frac{q+1}{2} \rfloor)}$ of \overline{N}_{T} which commute with one another, where $[\frac{q+1}{2}]$ is the greatest integer in $\frac{q+1}{2}$. Thus, $\overline{W}_{-} \mid (\overline{\Pi}_{0,i} \cup \overline{\Pi}_{0,q+2-i}) \mid (\overline{\Pi}_{0,i} \cup \overline{\Pi}_{0,q+2-i})$, $1=1,\dots,q+1$. Suppose now that T' is a subset of $\overline{\Pi}'$ of type A_{q} $(q \ge 1)$ and $N_{i} \longrightarrow N_{i}'$ is an isomorphism of T onto T'. Define $Z'_{T'O}$ as above and assume $Z'_{T'O}$ is non-zero and not simple. The above discussion holds for T' and we assume we have all the above notation (with primes added) for T'. We refer to the diagram for T' corresponding

to (8) as (8). Now, for any f_i , Π_o , f_i , and Π_o and any $1 \le i, i' \le q+1$, we say a *-isomorphism $\Pi_{i,i} \xrightarrow{f_o} \Pi'_{o,i'}$ is extendable if f_o takes the leftmost *-orbit of $\Pi'_{o,i'}$ in (8) onto the leftmost *-orbit of $\Pi'_{o,i'}$ in the diagram (8). We then have:

Lemma 1: Suppose $1 \le i, i' \le q+1$ and suppose we have an isomorphism $\mathcal{J}_{o,i} = \Phi_{o} \quad \mathcal{J}'_{o,i'}$. Then, we may choose $f_{o}, \quad \Pi_{o}, \quad f'_{o}, \quad \text{and} \quad \Pi'_{o} \quad \text{so that}$ $(f_{o} \cap f_{o,i})^{\varphi_{o}} = f_{o} \cap f_{o,i'}, \quad \Pi_{o,i} = \Pi'_{o,i'} \quad \text{and the following condition}$ holds: Suppose $\overline{w} \in \overline{W}$ such that \overline{w} stabilizes $\overline{\Pi}_{To}$ and fixes the elements of $\overline{\Pi}_{To} = \overline{\Pi}_{o} = \overline{W}_{o} \quad \text{otherwise}$ otherwise .

Then, there exists an isomorphism $(\mathcal{L}_{To}, \int_{I} \cap \mathcal{L}_{To}) \xrightarrow{V_{o}} (\mathcal{L}_{To}, \int_{I} \cap \mathcal{L}_{To})$ and a *-isomorphism $(\Pi_{T}, \Pi_{To}) \xrightarrow{f} (\Pi_{T}, \Pi_{To})$ such that $V_{e} | \mathcal{L}_{o,i} = \varphi_{e}$, $\Pi_{To} = \Pi_{To}$, $f | \Pi_{To} = (\overline{w}_{i} | \Pi_{To}) \cdot V_{o}^{*}$, and, if $(\overline{w} | \Pi_{o,i}) \cdot \varphi_{o}^{*}$ is extendable, $\mathcal{O}_{V_{i}} = \mathcal{O}_{V_{i}}$ for $j=1,\ldots,q$.

Proof: Let $\mathcal{L}_{o,i}$ be some Cartan subalgebra of $\mathcal{L}_{o,i}$ split by K and let $\Pi_{o,i}$ be some fundamental system for the roots of $((\mathcal{L}_{o,i})_{K}, (\mathcal{L}_{o,i})_{K})$.

For $1 \leq j \leq q+1$, $j \neq i$, choose $\varphi_{j} \in \mathcal{C}$ such that $\mathcal{L}_{V_{o,i}} = \mathcal{L}_{V_{o,i}} = \mathcal{L}_{V_{o,i}} = \mathcal{L}_{v_{o,i}}$. It follows from the first part of Prop. 4.2, that $\mathcal{L}_{o,i} = \mathcal{L}_{o,i} = \mathcal{L}_{o,i}$, $\mathcal{L}_{o,i} = \mathcal{L}_{o,i} = \mathcal{L}_{o,i} = \mathcal{L}_{o,i}$, and $\mathcal{L}_{o,i} = \mathcal{L}_{o,i} = \mathcal{L}_{o,i} = \mathcal{L}_{o,i}$. Let $\mathcal{L}_{o,i} = \mathcal{L}_{o,i} =$

for the simple summands of $[\mathcal{L}_o, \mathcal{L}_o]$ not contained in \mathcal{L}_{TO}). Then, by the second part of Prop. 4.2, we have $\varphi_{o,j}^* = \overline{W}_{i,j,j} \cap \mathcal{T}_{o,i}$, $1 \le j \le q+1$, $j \ne i$. Let $\mathcal{L}_{o,i}' = \mathcal{L}_{o,i}'$ and let $\mathcal{T}_{o,i}' = \mathcal{T}_{o,i}^{\varphi_o}^*$. Choose $\mathcal{L}_{o,j}' \cap \mathcal{T}_{o,i}'$, and $\mathcal{L}_{o,i}' \cap \mathcal{L}_{o,j}' \cap \mathcal{L$

Define $(\mathcal{L}_{T_0}, \mathcal{L}_{\cap}, \mathcal{L}_{\cap})$ $\stackrel{\psi_o}{=} (\mathcal{L}'_{T'_0}, \mathcal{L}'_{\cap}, \mathcal{L}'_{\cap})$ as follows: $\psi_o \mid (\mathcal{L}_{o,j}) = \begin{cases}
\varphi_o^{-1} \circ \varphi_o \varphi_{o,j} & \text{for } 1 \leq j \leq q+1, j \neq 1, 1' \\
\varphi_o & \text{for } j=1 \\
\varphi_{o,i} \circ \varphi_o \varphi_{o,i} & \text{for } j=1', \text{ if } i \neq 1'.
\end{cases}$

Then, $\Pi_{TO}^{\psi_0^*} = \Pi_{T'O}^{'}$ and

 $\Psi_{0} * | \Pi_{0,j} = \begin{cases} (\overline{W}_{(j,i)} | \Pi_{0,j}) \circ \varphi_{0}^{*} \circ (\overline{W}'_{(i',j)} | \Pi'_{0,i'}) & \text{for } 1 \leq j \leq q+1, \ j \neq 1, i' \\ \varphi_{0}^{*} & \text{for } j=1 \\ (\overline{W}_{(i',i)} | \Pi_{0,i'}) \circ \varphi_{0}^{*} \circ (\overline{W}'_{(i',i)} | \Pi'_{0,i'}) & \text{for } j=i'', \ \text{if } i \neq i'. \end{cases}$

Hence, $(\overline{W}_{ci,i'}, \Psi^*)|\Pi_{o,j} = (\overline{W}_{cj,i}, |\Pi_{o,j}) \circ \varphi_o^* \cdot (\overline{W}'_{ci',j}, |\Pi'_{o,i'}) \text{ for } 1 \leq j \leq q+1.$ Now, $\overline{W}_e|\Pi_{o,j} = (\overline{W}_{cj,i}, |\Pi_{o,j}) \circ (\overline{W}|\Pi_{o,i}) \circ (\overline{W}_{ci,j}, |\Pi_{o,i}) \text{ for } 1 \leq j \leq q+1.$ Thus, $(\overline{W}_e|\overline{W}_{ci,i'}, \Psi_o^*)|\Pi_{o,j} = (\overline{W}_{cj,i}, |\Pi_{o,j}) \circ (\overline{W}|\Pi_{o,i}) \circ \varphi_o^* \circ (\overline{W}'_{ci',j}, |\Pi'_{o,j}) \circ (\overline{W}|\Pi_{o,i}) \circ (\overline{W}|\Pi_{o,i})$

and it is then clear that $(\overline{W}_{\bullet}) = \overline{V}_{\bullet} *$ extends to a *-isomorphism

 $(\Pi_{\mathbf{T}}, \Pi_{\mathbf{T}^0}) \xrightarrow{\mathbf{f}} (\Pi'_{\mathbf{T}'}, \Pi'_{\mathbf{T}'^0})$ such that $\mathcal{D}_{\mathbf{x}_i} = \mathcal{D}_{\mathbf{x}_i'}$ for $1 \le j \le q$.

Suppose $(\overline{w} \mid \Pi_{o,i}) \circ \varphi_o^*$ is not extendable. But then

$$\begin{split} (\overline{w}_{i}|\Pi_{To}) \cdot \Psi_{o}^{*}|\Pi_{o,j} &= (\overline{w}_{cj,q+2-j}|\Pi_{o,j}) \circ ((\overline{w}_{e}|\overline{w}_{ci,i'})|\Psi_{o}^{*})|\Pi_{o,q+2-j}) \\ &= (\overline{w}_{cj,i})|\Pi_{o,j}\rangle \circ (\overline{w}|\Pi_{o,i}) \cdot Q_{o}^{*o}(\overline{w}_{ci',q+2-j}'|\Pi_{o,i'}'), \end{split}$$

It will be convenient in subsequent discussion to fix some choice of f, \mathcal{T}_0 , f', and \mathcal{T}_0' .

We now suppose that \mathcal{L}_{TO} is simple. By lemma 3.6, T contains 1 or 2 elements. We deal here only with the case when $T = \{\lambda_i, \lambda_k\}$ is a doubleton. Suppose that T' is a subset of $\overline{\Pi}'$ of type A_2 , $\lambda_i \longrightarrow \lambda_i'$ is an isomorphism of T onto T', and $\overline{\mathcal{L}}_{T'O}'$ is simple.

Lemma 2: Suppose \prod_T and $\prod_{T'}'$ are connected. Suppose we have a *-isomorphism $\prod_{TO} \xrightarrow{f_0} \prod_{T'O}' \cdot Then$, there exists $\overline{W} \in \overline{\mathbb{W}}_T$ and a *-isomorphism $(\overline{\Pi}_T, \overline{\Pi}_{TO}) \xrightarrow{f} (\overline{\Pi}_{T'}', \overline{\Pi}_{T'O}')$ such that $f(\overline{\Pi}_{TO}) \cdot f_0$ and $\overline{\mathcal{O}}_{\lambda_i'}^f = \overline{\mathcal{O}}_{\lambda_i'}^f$ for j=1,2.

Proof: By lemma 2.4, $\overline{\mathcal{M}}_{\overline{\Pi}_T} = \lambda_i + \lambda_i$. Thus, $\overline{\mathcal{O}}_{\lambda_i'}$ is a singleton $\{\alpha_i, \lambda_i', 1=1,2 \}$. It follows from Prop. 2.3 that if P_0 is a component of $\overline{\Pi}_{TO}$, then $\{\alpha_i, \lambda_i' \cup P_O \cup \{\alpha_i, \lambda_i'\} \text{ is connected.}$ Thus, $\overline{\Pi}_{TO}$ is connected. By lemma 2.7, $\alpha_i' \stackrel{\Pi}{\Pi}_T = \alpha_i'$. Thus, $\alpha_i' \stackrel{\Pi}{\Pi}_T = \alpha_i'$. Since $\alpha_i' \stackrel{\Pi}{\Pi}_T = \alpha_i'$ is connected.

and $\alpha_i^{1}\pi_{T} = \alpha_{\lambda}$, it follows in the first two cases that Π_{λ} is connected of type A_{n-1} with end root α_i and hence, since $\Pi_{To} \neq \phi$, $\alpha_i^{1}\pi_{\lambda} \neq \alpha_i$, contradicting Prop.2.7. Hence, Π_{To} is of type E_6 . Since Π_{To} is connected and $\alpha_i^{1}\pi_{T} = \alpha_{\lambda}$, (Π_{T}, Π_{To}) is of the form Π_{To} . The same remarks hold for $(\Pi_{T'}, \Pi_{T'o})$. By Prop. 2.7, Π_{To} is the map and Π_{To} is the map.

We low prove some lemmas about the extension of *-isomorphisms $\Pi_{o,o} \longrightarrow \Pi'_{s'}$ to *-isomorphisms $\Pi_{s} \longrightarrow \Pi'_{s'}$, where $\delta \in \Pi'$.

Lemma 3: Let $\emptyset \in \overline{\Pi}$, $\emptyset' \in \overline{\Pi}'$. Suppose that Π_{\emptyset} and $\Pi_{\emptyset'}$ are connected. Suppose we have an isomorphism

 $([\mathcal{I}_{8},\mathcal{I}_{-8}],\mathcal{J}\cap[\mathcal{I}_{8},\mathcal{L}_{-8}])\xrightarrow{\chi_{o}}([\mathcal{L}'_{8},\mathcal{L}'_{-8}],\mathcal{J}'\cap[\mathcal{L}'_{8},\mathcal{L}'_{-8}]).$ Put $\varphi_{o}=\chi_{o}[\mathcal{I}_{o,8}]$ and assume that $\mathcal{T}_{o,8}^{\varphi_{0}*}=\mathcal{T}_{o,8}^{\varphi_{0}*}$. Assume also that one of the following holds:

- (a) $234\sum$ and $23'4\sum'$.

Now, for $\alpha \in \mathbb{Z}$ such that $\overline{\alpha} = \mathbb{Y}$ and $\beta \in \Pi_{o,\mathbb{Y}}$, we have $\alpha - \beta \in \mathbb{Z} \iff [(\mathcal{L}_{K})_{\infty}, (\mathcal{L}_{K})_{-\beta}] \neq (0) \iff [(\mathcal{L}_{K})_{\infty}, (\mathcal{L}_{K})_{-\beta}]^{\beta} \neq (0) \iff \beta^{**} = \beta^{**} \in \mathbb{Z}',$ and similarly, $\alpha + \beta \in \mathbb{Z} \iff \alpha^{**} + \beta^{**} \in \mathbb{Z}'$. But $\mathcal{T}_{\mathbb{Y}}$ is the set of $\alpha \in \mathbb{Z}$ such that $\overline{\alpha} = \mathbb{Y}$ and $\alpha - \beta \notin \mathbb{Z}$ for $\beta \in \Pi_{o,\mathbb{Y}}$. Thus, $\mathcal{T}_{\mathbb{Y}}^{\beta} = \mathcal{T}_{\mathbb{Y}}^{\beta}$. Define $(\Pi_{\mathbb{Y}}, \Pi_{o,\mathbb{Y}}) = \mathcal{T}_{\mathbb{Y}}^{\beta}$, by $g \mid \Pi_{o,\mathbb{Y}} = \varphi_{o}^{**}$

and $g[\mathcal{O}_{g} = \rho^{*}|\mathcal{O}_{g}$.

We show first of all that g is an isomorphism of Dynkin diagrams. From the above, it follows that $(\alpha^g, \widehat{\beta^g}) = (\alpha, \widehat{\beta})$ for $\alpha \in \mathcal{O}_x$ and $\beta \in \Pi_{0,8}$. But $(\beta_1^{g}, \widehat{\beta_2^{g}}) = (\beta_1, \widehat{\beta_2})$ for $\beta_1, \beta_2 \in \Pi_{0,8}$. Hence, it suffices to show that if $(\beta, \widehat{\alpha})$ and $(\beta^g, \widehat{\alpha}^g)$ are negative then they are equal $(\alpha \in \mathcal{O}_{\delta}$, $\beta \in \mathcal{T}_{c,\delta})$, and that if α_i , α_{λ} are distinct elements of \mathcal{D}_{y} , then $(\alpha_{i}, \widehat{\alpha_{j}}) = (\alpha_{i}^{g}, \widehat{\alpha_{j}^{g}})$. If (a) holds, these statements are immediate since in the first case we must have $(\beta, \widehat{\alpha}) = (\beta^g, \widehat{\alpha^g}) = -1$ and the second case cannot occur (since $\mathcal{O}_{\mathbf{x}'}$ and $\mathcal{O}_{\mathbf{x}'}$ are necessarily singletons). Suppose (b) holds. Suppose α_1 , α_2 are distinct elements of $\overline{\mathcal{O}}_{\chi}$. Now $(\alpha_1, \widehat{\alpha_2})$ and $(\alpha_1^g, \widehat{\alpha_2^g})$ lie in \$0,-1\$ and hence it suffices to show they are zero together. But if $(\ll, \sim) = 0$, there exists a non-empty subset P_o of $\prod_{o, \forall i}$ such that fail Po fail is connected, hence fail by Pou fait is connected, and thus (since $P_o^g \neq \phi$) $(\alpha_i^g, \widehat{\alpha_a^g}) = 0$. The converse is similar. Suppose $\alpha \in \mathcal{O}_{\delta}$, $\beta \in \mathcal{T}_{\delta,\delta}$, and $(\beta,\widehat{\alpha})$ and $(\beta^g,\widehat{\alpha^g})$ are negative. Both quantities lie in \(\begin{aligned} -1,-2 \\ \end{and} \end{and} \text{ hence it suffices} \end{aligned} to show that $(\beta, \widehat{\alpha}) = -2$ if and only if $(\beta^g, \widehat{\alpha^g}) = -2$. Suppose for contradiction that $(\beta, \widehat{\alpha}) = -2$ and $(\beta^g, \widehat{\alpha^g}) = -1$. Since $(\beta, \widehat{\alpha}) = -2$ and Π_{γ} is connected, we have $\mathcal{O}_{\gamma} = \{\alpha \}$. Therefore, $\mathcal{D}_{\chi_i} = \int_{\mathcal{A}} \int_{\gamma_i}^{\gamma_i} d\gamma_i \cdot (\Pi_{\chi_i}, \Pi_{\chi_i})$ is of the form • If \prod_{y} is of type B, then \prod_{y}' is of type A (since $(A^{g}, \widehat{A^{g}}) = -1$) and hence $2 \forall ' \notin \sum'$, a contradiction. Thus, $(\prod_{y}, \prod_{e,y})$ is of the form . If there exists $\beta_2 \in \prod_{o,Y}$ such that $(\beta, \beta_2) < 0$, then $2\beta + 3\alpha + 2\beta + \beta_2 \in \Sigma$ and hence $3\gamma \in \Sigma$, a contradiction. Thus, But $(\Pi'_{y'}, \Pi'_{o,y'})$ $(\Pi_{\sigma}, \Pi_{c,g})$ is of the form is not for type A and hence $(\mathcal{T}_{\chi'}, \mathcal{T}_{\chi'})$ is of the form

Since $3 \ \xi' \in \Sigma'$, we have as above that $(\prod_{y'}, \prod_{o,y'})$ is of the form $\beta = \emptyset$, and hence $(\prod_{y}, \prod_{o,y})$ is of the form $\beta = \emptyset$.

Then, $\beta \in \prod_{o, \ni y}$ and $\beta \notin \prod_{o, \ni y'}$. Moreover, $\beta \notin \prod_{o, \ni y}$ and $\beta \in \prod_{o, \ni y'}$. This contradicts (b). The converse is similar. Therefore, g is an isomorphism of Dynkin diagrams.

It remains to show that g commutes with the *-action. For this we may assume that $\Pi = \{ \chi \}$ and $\Pi' = \{ \chi \}$. Since ρ commutes with the actions of \mathcal{L} on $(\mathcal{L}_\chi)_K$ and $(\mathcal{L}_\chi)_K$ and \mathcal{L}_{σ} commutes with the actions of \mathcal{L} on $[\mathcal{L}_o, \mathcal{L}_o]_K$ and $[\mathcal{L}_o', \mathcal{L}_o']_K$, it follows that $\rho^* = \sigma \rho^*$ and $\rho_o^* = \sigma \rho^*$ for $\sigma \in \mathcal{L}$. This together with the fact that conjugation by g takes the Weyl group of Π_χ' , implies that g commutes with the *-action. q.e.d.

Let $\emptyset \in \Pi$ and suppose $2 \% \notin \Sigma$. Suppose Π_{δ} is connected and $\Pi_{\delta, \delta} \neq \Phi$. Then, D_{δ} is a singleton $\{\alpha\}$ and we may write $M_{\Pi_{\delta}} = \alpha + \sum_{\beta \in \Pi_{\delta, \delta}} m_{\beta} \beta$ and $\delta = \alpha + \sum_{\beta \in \Pi_{\delta, \delta}} q_{\beta} \beta$ for some positive integers m_{δ} and rational q_{δ} . Moreover, $\alpha^{W_{\delta}} = -M_{\Pi_{\delta}}$, $(\alpha, M_{\Pi_{\delta}}) = 0$, and $q_{\delta} + q_{\beta} W_{\delta} = m_{\delta} = m_{\delta} W_{\delta}$ for $\beta \in \Pi_{\delta, \delta}$.

Proof: The first statement follows from the facts that $2 \% \sum_{i} f_{i} = \gamma$, and (by the corollary to lemma 2.2) % is in the \mathbb{Q} -space generated by $\mathbb{T}_{\mathbb{Q}}$.

Now, $-\alpha^{\widetilde{W}_S} + \alpha \notin \sum$ (since $2 \forall \notin \sum$) and $-\alpha^{\widetilde{W}_S} + \beta \notin \sum$ for $\beta \in \Pi_{0,Y}$ (since $\alpha - \beta^{\widetilde{W}_S} + \sum_{\beta \in \Pi_{0,Y}} q_{\beta} = -\alpha + \sum_{\beta \in \Pi_{0,Y}} (q_{\beta} W_{\gamma} - m_{\beta}) \beta$ and $\beta^{\widetilde{W}_S} = -\beta = -\alpha - \sum_{\beta \in \Pi_{0,Y}} q_{\beta}$. Thus, $q_{\beta} + q_{\beta} W_{\gamma} = m_{\beta}$, $\beta \in \Pi_{0,Y}$. Since $\beta \in \Pi_{0,X}$

 $\overline{w}_{\chi}^2 = 1$, we have $m_{\beta} = m_{\beta} \overline{w}_{\chi}$ for $\beta \in \prod_{\alpha, \gamma}$.

Suppose for contradiction that $(\alpha, \mathcal{M}_{\Pi_{\delta}}) \neq 0$. Then, $(\mathcal{M}_{\Pi_{\delta}}, \alpha) > 0$.

Therefore, $0 < (\mathcal{M}_{\Pi_{\delta}}, \alpha) = 2 + \sum_{\beta \in \Pi_{\delta, \delta}} m_{\beta} (\beta, \alpha)$. Thus, $- \sum_{\beta \in \Pi_{\delta, \delta}} m_{\beta} (\beta, \alpha) < 2$. Therefore, there exists a unique element $\beta \in \Pi_{\delta, \delta}$ such that $(\beta, \alpha) < 0$, and then $m_{\beta} = 1$. Thus, $\Pi_{\delta, \delta}$ is connected. Since $\Pi_{\delta, \delta} \neq 0$ and $\alpha \in \Pi_{\delta} = 0$. Thus, by lemma 3.1, $\Pi_{\delta} = \{\beta, \beta\}$ is connected. Thus, $\Pi_{\delta} = \{\alpha, \beta, \beta\}$. Therefore, $\mathcal{M}_{\Pi_{\delta}} = \alpha + \beta_{\delta}$. Thus, Π_{δ} is of type A and we have a contradiction. q.e.d.

Corollary: Let $\delta \in \Pi$ such that $2\delta \notin \Sigma$. Suppose Π_{δ} is connected and $\Pi_{\delta,\delta}$ is connected $\neq \phi$. Let $\mathcal{O}_{\delta} = \{\alpha \}$, let β_i be the element of $\Pi_{\delta,\delta}$ connected to α , and let $\beta_{\delta} = \beta_i^{-\overline{W}_{\delta}}$. Let P_{δ} be the smallest connected subset of $\Pi_{\delta,\delta}$ containing β_i and β_{δ} , and put $\beta_{\delta} = \sum_{\beta \in P_{\delta}} \beta_{\delta}$. Then, $\beta_{\delta} = \beta_i^{-1}\Pi_{\delta,\delta}$, the coefficients of β_i and β_{δ} in $\mathcal{M}_{\Pi_{\delta,\delta}}$ are 1, P_{δ} is of type A, and $\mathcal{M}_{\Pi_{\delta,\delta}} = -\beta_{\delta} + q(\lambda_{\beta_i} + \lambda_{\beta_i})$, where λ_{δ_i} is the fundamental dominant integral weight on $(\beta_i \cap \mathcal{L}_{\delta,\delta})_K$ corresponding to β_i , 1=1,2, and $q = -(\alpha, \beta_i)$.

Proof: Now, $\alpha^{1}\Pi_{X} = \alpha$. Thus, $\beta_{i}^{1}\Pi_{X} = \beta_{i}^{1}$. But $\Pi_{O_{i}X} = (1_{\Pi_{X}}|\Pi_{O_{i}X}) \cdot 1_{\Pi_{O_{i}X}}$. Therefore, $\beta_{2} = \beta_{i}^{1}\Pi_{O_{i}X}$. Now, if the coefficient of β_{i}^{1} in $\mathcal{M}_{\Pi_{O_{i}X}}$ is > 1, we have $2\alpha + \mathcal{M}_{\Pi_{O_{i}X}} \in \Sigma$ and hence $2X \in \Sigma$. Therefore, the coefficient of β_{i}^{1} (and hence of β_{2}^{1}) in $\mathcal{M}_{\Pi_{O_{i}X}}$ is 1. Thus, P_{O} is of type A. Now, there exists a non-empty sequence $\alpha_{1}, \ldots, \alpha_{m}$ of elements of Σ such that $\alpha_{i}^{1} = \alpha_{i}^{1}, \ldots, \alpha_{m}^{1}, \alpha_{i}^{1} \in \Pi_{O_{i}X}$ for $1 = 1, \ldots, m-1$, $\alpha_{i}^{1} = \mathcal{M}_{\Pi_{X}}$, and $\alpha_{m}^{1} = \alpha_{m}^{1} \in \Pi_{O_{i}X}$. Moreover, $\mathcal{M}_{\Pi_{O_{i}X}}$ is the root of greatest height with this property. But $(\mathcal{M}_{\Pi_{X}}, \alpha_{i}^{1}) = 0$, β_{i}^{1}

is the unique element of $\Pi_{o,\delta}$ such that $(\alpha, \beta_i) < 0$, and, since $\mathcal{M}_{\Pi_{\delta}} = -\alpha^{\overline{W}_{\delta}}, \quad \beta_{\delta} \text{ is the unique element of } \Pi_{o,\delta} \text{ such that } (\mathcal{M}_{\Pi_{\delta}}, \beta_{\delta}) > 0.$ Thus, $\mathcal{M}_{\Pi_{o,\delta}} = \mathcal{M}_{\Pi_{\delta}} - \beta_{o} - \alpha. \quad \text{Then, for } \beta \in \Pi_{o,\delta},$ $(\mathcal{M}_{\Pi_{o,\delta}} + \beta_{o}, \beta) = (\mathcal{M}_{\Pi_{\delta}}, \beta) - (\alpha, \beta) = -(\alpha, \beta^{\overline{W}_{\delta}}) - (\alpha, \beta)$ $= q \lambda_{\beta_{\delta}}(\widehat{\beta}) + q \lambda_{\beta_{\delta}}(\widehat{\beta}).$

Therefore, $\mathcal{M}_{\Pi_{o,\delta}} = -\beta_o + q(\lambda_{\beta_i} + \lambda_{\beta_2})$. q.e.d.

Lemma 5: Let $\% \in \Pi$ and $\% \in \Pi'$ and suppose $2\% \notin \Sigma'$ and $2\%' \notin \Sigma'$. Suppose $\Pi_{\delta, \emptyset}$ and $\Pi_{\delta, \emptyset}'$ are connected and suppose $\Pi_{\delta, \emptyset}$ and $\Pi_{\delta, \emptyset}'$ are not of *-type D_{4I} . Suppose one of the following holds:

- (a) $\overline{W}_{g} / \prod_{o, v}$ extends to a *-automorphism of \prod_{v} and $\overline{W}'_{g} / \prod_{o, v}$ extends to a *-automorphism of \prod_{v} .
- (b) There exists at most one $\alpha_o \in \Sigma$ such that $\overline{\alpha_o} = X$ and $(\alpha_o', \alpha) = (\alpha_o', \alpha^{\overline{W_Y}}) = 0$; and there exists at most one $\alpha_o' \in \Sigma'$ such that $\overline{\alpha_o'} = X'$ and $(\alpha_o', \alpha') = (\alpha_o', \alpha'^{\overline{W_Y'}}) = 0$, where $\overline{U_Y} = \{\alpha_o' \in X' \text{ and } \overline{U_{Y'}} = \{\alpha_o' \in X' \text{ and } \overline{$

Suppose we have a *-isomorphism $\prod_{o,\gamma} \frac{g_{\bullet}}{-1} \prod_{o,\gamma}'$. Then, either g_{\bullet} or $(\overline{\mathbb{W}}_{g} \mid \Pi_{o,\gamma}) \circ g_{\bullet}$ extends to a *-isomorphism $(\prod_{\gamma}, \prod_{o,\gamma}) \longrightarrow (\prod_{\gamma}', \prod_{o,\gamma}')$. In particular, if (a) holds, g_{\bullet} extends to a *-isomorphism $(\prod_{\gamma}, \prod_{o,\gamma}) \longrightarrow (\prod_{\gamma}', \prod_{o,\gamma}')$.

<u>Proof:</u> We may assume $\Pi_{a,8} \neq \phi$ and $\Pi_{a,8} \neq \phi$.

Suppose $\Pi_{o,X}$ and $\Pi_{o,X'}$ are not connected. Then, by lemma 3.1, $\Pi_{X'}$ and $\Pi_{X'}$ are of type A and hence $(\Pi_{X'}, \Pi_{o,X'})$ and $(\Pi_{X'}, \Pi_{o,X'})$ are of the form $\Pi_{X'}$ (since $\Pi_{o,X'}$ and $\Pi_{c,X'}$ are *-connected, $\Pi_{X'} = X$, and $\Pi_{X'} = X'$). By Prop. 2.7, $\Pi_{o,X'}$ is the map and the result is clear.

(9)

Suppose $\prod_{a,b}$ and $\prod_{a,b'}$ are connected. We use the notation of the previous corollary and similar primed notation for $(\prod_{j'}, \prod_{a,b'})$. It suffices then to show that q=q', and $\beta_i^{g_o}=\beta_i'$ or $\beta_i^{g_o}=\beta_i'$. We note that if (a) holds, $\beta_i=\beta_a$ and $\beta_i'=\beta_a'$.

We put $\beta_i'' = \beta_i' S_o^{-1}$, $\beta_a'' = \beta_o' S_o^{-1}$, $P_a'' = P_o' S_o^{-1}$, $\beta_o'' = \beta_o' S_o^{-1}$, and q'' = q'. Then, $\{\beta_i', \beta_a'\}$ (resp. $\{\beta_i'', \beta_a''\}$) is an orbit of $\mathbf{1}_{\prod_{o, \delta}}$, P_o (resp. P_o'') is the smallest connected subset of $\prod_{o, \delta}$ containing β_i and β_a (resp. β_i'' and β_a''), P_o (resp. P_o'') is of type A, the coefficients of β_i and β_a (resp. β_i'' and β_a'') in $\mathcal{M}_{\prod_{o, \delta}}$ are 1, and

 $-\beta_{o} + q(\lambda_{\beta_{i}} + \lambda_{\beta_{a}}) = -\beta_{o}'' + q'' (\lambda_{\beta_{i}''} + \lambda_{\beta_{a}''}).$ By (9), it suffices to show that $\{\beta_{i}, \beta_{a}\} = \{\beta_{i}'', \beta_{a}''\}$ (since then q=q' and $\{\beta_{i}, \beta_{a}\} = \{\beta_{i}', \beta_{a}'\}$. We note that if (a) holds, $\beta_{i} = \beta_{a} \text{ and } \beta_{i}'' = \beta_{a}''.$

Suppose for contradiction that $\{\beta_1, \beta_2\} \neq \{\beta_1'', \beta_2''\}$. Then, $\{\beta_1, \beta_2\} \cap \{\beta_1'', \beta_2''\} = \phi$. Thus, from the nature of P_o and P_o'' , it follows that $R'' \subseteq P_o$, $P_o \subseteq P_o''$, or $P_o'' \cap P_o = \phi$.

Suppose $P_o \subseteq P_o$. Taking the Killing form of (9) with $\widehat{\beta_o}$, we obtain $-2+2q = -(\beta_o'', \widehat{\beta_o}) + 2q''$. Therefore, $(\beta_o'', \widehat{\beta_o}) = -2(q-q''-1)$. Taking the Killing form of (9) with $\widehat{\beta_o''}$, we obtain $-(\beta_o', \widehat{\beta_o''}) + 0 = -2+2q''$. Thus, $(\beta_o', \widehat{\beta_o''}) = -2(q''-1)$. But, since β_o and β_o'' are not proportional, $(\beta_o', \widehat{\beta_o''})(\beta_o'', \widehat{\beta_o}) \in \{0,1,2,3\}$ and $(\beta_o', \widehat{\beta_o''})(\beta_o'', \widehat{\beta_o}) = 4(q''-1)(q-q''-1)$. Thus, $(\beta_o', \widehat{\beta_o''})(\beta_o'', \widehat{\beta_o}) = 0$. Therefore, $(\beta_o', \widehat{\beta_o''}) = (\beta_o'', \widehat{\beta_o}) = 0$. Thus, $(\beta_o', \beta_o'') = 0$, $(\beta_o'', \beta_o'') = 0$.

and $\beta \neq \beta_2$. Since $\beta_1 \neq \beta_2$, (b) holds. Therefore, there exists at most one $\alpha_0 \in \Sigma$ such that $\overline{\alpha_0} = \emptyset$ and $(\alpha_0, \alpha) = (\alpha_0, \alpha^{\overline{W}_{\delta}}) = 0$. But both $\alpha + 2\beta_1$ and $\alpha + 2\beta_1 + \beta_2$ have this property.

The case $P_o \nsubseteq P_o''$ is disposed of similarly.

Suppose $P_o \cap P_o'' = \phi$. Taking the Killing form of (9) with \mathcal{L}_o , we obtain $-2+2q = -(\beta_o'', \widehat{\beta}_o)+0$. Hence, $(\beta_o'', \widehat{\beta}_o') = -2(q-1)$. Similarly, $(\beta_o, \beta_o^{\mu}) = -2(q^{\mu}-1)$ and hence, as above, $(\beta_o^{\mu}, \beta_o) = 0$, q=1, and q''=1. Therefore, no element of P, is connected to an element of P". But, by (9), $(\beta_0, \widehat{\beta}) = (\beta_0'', \widehat{\beta})$ for $\beta \in \Pi_{0,0} - \{\beta_0, \beta_1, \beta_2, \beta_1'', \beta_3''\}$. Then, there exists a unique $\beta_3 \in \mathcal{T}_{0,8}$ such that $(\beta_0,\beta_3) < 0$ and $(\beta_0'',\beta_3) < 0$. (Such an element exists since $\mathcal{T}_{o,\gamma}$ is connected and is unique since $\mathcal{T}_{o,\gamma}$ contains no loops.) But β_{3}^{1} in, also has this property. Therefore, $\beta_3^{1}\pi_{e,3}=\beta_3$. Thus, β_3 is connected to the middle roots of P and P. (and each of these sets contains an odd number of elements). If $\beta_1 \neq \beta_2$, it is easy to see that $\prod_{a,b}$ is of the form $\beta_1 \neq \beta_2 \neq \beta_3 \neq \beta_3 \neq \beta_4$ But then $\beta_0 = \beta_1 = \beta_2$, $\beta_0'' = \beta_1'' = \beta_2''$, and times $(\beta_1, \beta_2) = 0$ and $(\beta_i, \widehat{\beta}) = (\beta_i^{"}, \widehat{\beta})$ for $\beta \in \mathcal{N}_{0,8} = \beta_i^{"}, \beta_i^{"}$. But since β_i and $\beta_i^{"}$ have coefficient 1 in $\mathcal{M}_{\mathcal{H}_{X}}$, this implies that we also have $(\beta, \widehat{\beta},) = (\beta, \widehat{\beta}'')$ for $\beta \in \mathcal{T}_{0,\delta} - \beta \beta, \beta''_{i,\delta}$ (since both quantities must lie in $\{0,-1,0\}$). Thus, the map which fixes $\Pi_{0,0} - \{\beta,\beta,\beta''\}$ and interchanges $oldsymbol{eta}_i$ and $oldsymbol{eta}_i^{"}$ is a non-trivial automorphism of Dynkin diagrams which is not the opposition involution. Therefore, $\Pi_{o,\gamma}$ is of type D_n (n even) and β , and β , are the two roots interchanged by

the automorphism group of $\prod_{o,v}$. Since \propto is connected to β_i , we must have n=4 or 6. Suppose n=4. Then, $\prod_{o,v}$ is not of *-type D_{41} . But, since \propto and \propto are fixed by the *-action of β_i , β_i and β_i'' are fixed by the *-action of β_i . Thus, $\beta_i = \beta_i''$ and we have a contradiction. Suppose n=6. Then, $(\prod_{v}, \prod_{o,v})$ is of the form

. But the coefficient of \propto in M_{11} is then 2 and we have a contradiction. q.e.d.

Because lemma 5 does not apply when $\Pi_{e,V}$ and $\Pi'_{e,V}$ are connected of *-type D_{41} , it seems necessary to include some remarks which will enable us to deal with this case (at least some of the time). Let \mathcal{M}_o be an anisotropic central simple Lie algebra over \mathcal{H}_e with Cartan subalgebra $\int_{\mathcal{M}_o}$ split by K and index $\Pi'_{\mathcal{M}_o}$ of *-type D_{41} . Label the roots of Π_{m_o} as follows: $\frac{\beta_2}{\beta_4} = \frac{\beta_2}{\beta_3}$ Let $\frac{\beta_2}{\beta_4} = \frac{\beta_2}{\beta_4} = \frac{\beta_4}{\beta_4} = \frac{\beta_4}{\beta_4}$

Lemma 6: Let $\mathcal{H} \in \Pi$ and $\mathcal{H}' \in \Pi'$ and suppose $2\mathcal{H} \in \Pi'$ and $2\mathcal{H}' \in \Pi'$. Suppose $\Pi_{\mathcal{H}}$ and $\Pi_{\mathcal{H}'}$ are connected and suppose $\Pi_{0,\mathcal{H}}$ and $\Pi_{0,\mathcal{H}'}$ are connected of *-type $D_{4\mathbf{I}}$. Suppose $\mathcal{I}_{0,\mathcal{H}}$ is not isomorphic to the skew transformations with respect to the trace form in a Cayley division algebra and suppose the same for $\mathcal{I}_{0,\mathcal{H}'}$. Suppose we have an isomorphism $(\mathcal{I}_{0,\mathcal{H}},\mathcal{I}_{0,\mathcal{H}'}) = \mathcal{I}_{0,\mathcal{H}'}$ such that $\Pi_{0,\mathcal{H}}^{\mathcal{H}} = \Pi_{0,\mathcal{H}'}$. Then, there exists a *-isomorphism $(\Pi_{\mathcal{H}},\Pi_{0,\mathcal{H}}) \xrightarrow{f} (\Pi_{\mathcal{H}'},\Pi_{0,\mathcal{H}'})$ such that $f(\Pi_{0,\mathcal{H}}) = \varphi_0^*$.

Proof: $(\Pi_{\delta}, \Pi_{\bullet,\delta})$ and $(\Pi'_{\gamma'}, \Pi_{\bullet,\delta'})$ are of the form \bullet . Label the roots of $\Pi_{\bullet,\delta}$ as follows: $\stackrel{\beta'}{\beta_{\bullet}} = \stackrel{\beta'}{\beta_{\bullet}} = \stackrel{\beta'}{\beta_{\bullet}}$. It suffices to show that $P_{\bullet}^{p^*} = P_{\bullet}'$. Let $\lambda_{B_{\bullet}}$ be the dominant integral weight of $(f_{\bullet} \cap f_{\bullet,\delta})_K$ corresponding to P_{\bullet} , f_{\bullet} ,

We also need:

Lemma 7: Let $\% \in \mathbb{T}$ such that $2\% \in \mathbb{Z}$. Suppose $\mathbb{T}_{\%}$ is connected and $\mathbb{T}_{0,2\%} = \phi$. Then, $\mathcal{L}_{\%}$ does not contain a simple summand which is isomorphic to the skew transformations with respect to the trace form in a Cayley division algebra over \mathcal{A} .

<u>Proof:</u> Let $\mathcal{J}_{o,i}$ be a simple summand of $\mathcal{J}_{o,i}$ which is isomorphic to the skew trasformations with respect to the trace form in a Cayley division algebra over \mathcal{R} . Let $\mathcal{T}_{l_{o}}$, be the corresponding *-component of $\mathcal{T}_{c,\delta}$. Then, $\mathcal{T}_{c,i}$ is connected of *-type D_{41} . If \mathcal{T}_{δ} contains two elements, then each of these elements is connected to $\mathcal{T}_{\mathbf{c},i}$ and hence it is easy to see that $\Pi_{\alpha, \beta, \gamma} \cap \Pi_{\alpha, \beta} \neq \phi$. Thus, \mathcal{O}_{δ} is a singleton $f \propto f_{\alpha}$ It is then clear that \prod_{γ} is of *-type D_{nI} ($n \ge 5$) and $(\prod_{\gamma}, \prod_{\alpha, \gamma})$ is of If n 6, it follows from Prop. 2.7 that $\overline{W}_{g} \mid \mathcal{T}_{0,g}$ is non-trivial. But, since $\overline{\mathcal{T}_{0,2g}} = \phi$, we have by the same proposition that $\overline{w}_{\delta} | \Pi_{0,\delta} = \overline{w}_{a,b} | \Pi_{0,\delta}$ is trivial. Thus, n=6 and $(\Pi_{\delta}, \Pi_{0,\delta})$ is of the form: , where $\mathcal{T}_{0,a} = \int \mathcal{B}_{a} k$ is the other *-component of $\prod_{o,a}$. Let $\mathcal{J}_{o,a}$ be the simple summand of $\mathcal{J}_{o,a}$ corresponding to $\Pi_{\bullet, \bullet}$. Let $(\mathcal{J}_{\bullet, \times})_{\kappa} - f \rightarrow \operatorname{End}_{\kappa}((\mathcal{J}_{\times})_{\kappa})$ be the adjoint representation of $(\mathcal{J}_{o,X})_{K}$ in $(\mathcal{J}_{X})_{K}$. By Prop. 2.8, f is equivalent to the representation of $(\mathcal{J}_{0,7})_{K}$ with highest weight the sum of the fundamental dominant weights corresponding to β_i and β_a . Let $\lambda_{\beta_i}:(\mathcal{L}_{\alpha} \cap \mathcal{L}_{\alpha_i})_{K} \longrightarrow K$ be the fundamental dominant weight corresponding to β_i and let $(\mathcal{J}_{i})_{v} \longrightarrow \operatorname{End}_{v}(V_{i})$ be the corresponding representation, i=1,2. Then, as an $(\mathcal{J}_{0,K})_{K} = (\mathcal{J}_{0,L})_{K} \oplus (\mathcal{J}_{0,L})_{K}$ module, we have $(\mathcal{J}_{K})_{K} \cong V_{L} \otimes V_{L}$. Thus, as an $(\mathcal{L}_{s,i})_K$ module, we have $(\mathcal{L}_{s})_K \cong V_i \oplus V_i$. Thus, the centralizer of $\rho((\mathcal{L}_{o, \bullet})_{K})$ in $\operatorname{End}_{K}((\mathcal{L}_{X})_{K})$ is isomorphic to the 2×2 matrices M2(K) with coefficients in K. But the centralizer C of $_{\mathscr{S}}(\mathscr{L}_{_{\mathcal{S}}})$ in End $_{\mathscr{R}}(\mathscr{L}_{_{\mathcal{S}}})$ is a form of this algebra and hence $^{\mathsf{L}}$ is either a division algebra or isomorphic to $M_2(A)$. But $f(\mathcal{L}_a) \in \mathcal{L}$ and

hence $\rho(f_{0,2}) = [\rho(f_{0,2}), \rho(f_{0,2})] \in [\mathcal{C}, \mathcal{C}]$. Thus, since $\rho(f_{0,2})$ and $[\mathcal{C}, \mathcal{C}]$ have dimension 3, we have $\rho(f_{0,2}) = [\mathcal{C}, \mathcal{C}]$. But $\rho(f_{0,2})$ is anisotropic and hence \mathcal{C} is not isomorphic to $\mathcal{M}_2(f_{0,2})$. Therefore, \mathcal{C} is a division algebra. Thus, $f_{0,2}$ is an irreducible $f_{0,2}$, module. But $(f_{0,2}) \in \mathcal{V}_1 \oplus \mathcal{V}_2$ as an $(f_{0,2}) \in \mathcal{C}_2$ module and $f_{0,2} \in \mathcal{C}_2$ is isomorphic to the skew transformations with respect to the trace form in a Cayley division algebra over $f_{0,2} \in \mathcal{C}_2$. Therefore, $f_{0,2} \in \mathcal{C}_2$ is not irreducible as an $f_{0,2} \in \mathcal{C}_2$, module and we have a contradiction. q.e.d.

In order to apply lemma 5 to algebras of restricted type G2, we will need the following: Lemma 8: Suppose Π is of type G_2 , Π is connected and $\Pi_o \neq \phi$. Label the roots of \prod as follows: χ_{3} . Then, $\prod_{0,\chi_{2}} = \phi$, $\prod_{\chi_{1}}$ is connected, \mathcal{O}_{δ_i} is a singleton f_{α_i} , and there exists at most one Proof: The first three statements follow from Prop. 3.6 and Prop. 3.7. By Prop. 3.7, $\mathcal{O}_{\delta_i} \cup \mathcal{T}_{\delta_2}$ is of the form $\mathcal{O}_{\delta_i} = \{\alpha_i\}$ and $\mathcal{O}_{\delta_{\lambda}} = \{ \alpha_{\delta} | \{ \}, \} \text{ Suppose } \alpha_{\delta} \in \sum \text{ such that } \alpha_{\delta} = \emptyset, \text{ and } (\alpha_{\delta}, \alpha_{\delta}) = (\alpha_{\delta}, \alpha_{\delta}, \alpha_{\delta}) = 0. \}$ We show that $\alpha_{\alpha} = (\alpha_1 + \alpha_2)^{\overline{W}_{X_i}} - (\alpha_1 + \alpha_2)$. Now, α_0 is of the form $\alpha_{i} + \sum_{A \in \mathcal{I}_{i}} m_{\beta} \beta \text{ with } m_{\beta} \in \mathbb{Z}.$ Hence, since $(\alpha_{\beta}, \beta) = 0$ for $\beta \in \mathcal{I}_{0}$, $(\alpha_2, \alpha_0) = (\alpha_2, \alpha_1)$. Similarly, $(\alpha_2, \alpha_0^{\overline{W}_{g_1}}) = -(\alpha_2, \alpha_1)$. Therefore, $(\alpha_1' + \alpha_2, \alpha_0') = (\alpha_2, \alpha_1') < 0$ and $((\alpha_1' + \alpha_2')^{\overline{W}_{Y_1}}, \alpha_0') = -(\alpha_2, \alpha_1') > 0$. Thus, $\alpha_1' + \alpha_2' + \alpha_3' \in \sum$ and $(\alpha_1' + \alpha_3')^{\overline{W}} = \alpha_3' \in \sum$. But $(\alpha_1 + \alpha_2)^{\overline{W}_{\delta_1}} - \alpha_0 = \delta_1 + \delta_2$ and $(\alpha_1 + \alpha_2 + \alpha_3)^{\overline{W}_{\delta_1}} = \delta_1 + \delta_2$. Therefore, we may write $(\alpha_1 + \alpha_2)^{\overline{W}} = \alpha_0 = \alpha_1 + \alpha_2 + \alpha_3$ and $(\alpha_1 + \alpha_2 + \alpha_3)^{\overline{W}} = \alpha_1 + \alpha_2 + \alpha_3$

where ω_o and V_o are non-negative integral sums of elements of $\Pi_{o,g}$.

Therefore, $\alpha_o = (\alpha_1 + \alpha_2)^{\overline{W}_{g_1}} - \alpha_1 - \alpha_2 - \omega_0 = (\alpha_1 + \alpha_2)^{\overline{W}_{g_1}} - \alpha_1 - \alpha_2 + V_o^{\overline{W}_{g_1}}$.

Thus, $-\omega_o = V_o = 0$ and $\alpha_o = (\alpha_1 + \alpha_2)^{\overline{W}_{g_1}} - (\alpha_1 + \alpha_2)$. q.e.d.

We will need the following calculation:

Lemma 9: Let $\% \in \Pi$ and suppose $(\Pi_{\chi}, \Pi_{\rho, \chi})$ is of the form

with f components of type A_{2g+1} . Then, $(\ll, \ll) = f(g+1)(\forall, \forall)$ for $\ll \in \mathcal{O}_{\delta}$.

Proof: Label the roots of \mathcal{O}_{δ} as indicated in the following diagram:

$$\beta_{i,1}', \beta_{i,2}', \beta_{f,3}' \approx_{f} \beta_{f,3}, \beta_{f,3} \beta_{f,3}$$
Put $\lambda_{i} = \frac{g+1}{2} \alpha_{i} + \sum_{j=1}^{3} \frac{j}{2} (\beta_{i,j} + \beta_{j,j}')$ for $i=1,\ldots,f$. Then,
$$(\lambda_{i}, \widehat{\alpha_{i}}) = 1 \text{ for } i=1,\ldots,f, (\lambda_{i}, \alpha_{j}') = 0 \text{ for } 1 \leq i,j \leq f, i \neq j, \text{ and}$$

$$(\lambda_{i}, \beta_{j,k}) = (\lambda_{i}, \beta_{j,k}') = 0 \text{ for } 1 \leq i,j \leq f \text{ and } 1 \leq k \leq g. \text{ Put}$$

$$\lambda = \sum_{i=1}^{3} \frac{2}{(\alpha_{i}, \alpha_{i})} \lambda_{i}. \text{ Then, } (\lambda_{i}, \alpha_{j}') = 1 \text{ for } 1 \leq j \leq f \text{ and } \lambda \text{ is}$$
orthogonal to all elements of $\prod_{i \neq j} \beta_{i,j}$. But
$$(\frac{1}{(\lambda_{i}, \lambda_{j})} \lambda_{i}, \alpha_{j}') = \frac{(\lambda_{i}, \alpha_{j}')}{(\lambda_{i}, \lambda_{j}')} = \frac{(\lambda_{i}, \lambda_{j}')}{(\lambda_{i}, \lambda_{j}')} = 1$$
for $1 \leq j \leq f$ and $\frac{1}{(\lambda_{i}, \lambda_{j}')} \lambda_{i}$ is orthogonal to all elements of $\prod_{i \neq j} \beta_{i,j}$. But by

Thus, $\lambda = \frac{1}{\langle Y, Y \rangle} \gamma$ is orthogonal to all elements of \prod_{χ} . But by the corollary to lemma 2.2, $\lambda = \frac{1}{\langle Y, Y \rangle} \gamma$ is in the Q-space generated by Therefore, $\lambda = \frac{1}{\langle Y, Y \rangle} \gamma$. Thus, $\lambda = 2(\chi, \chi) \sum_{i=1}^{J} \frac{\lambda_i}{\langle x_i, x_i \rangle}$. But $(x_i, x_i) = (x_i, x_j)$ for $1 \le i, j \le f$. Thus, if $x \in \mathcal{O}_{\chi}$, $\lambda = 2(\chi, \chi) \sum_{i=1}^{J} \lambda_i$. Now, $\lambda = \frac{g+1}{2} x_i = \frac{g+1}{2} \gamma$, $1 \le i \le f$. Thus, for $x \in \mathcal{O}_{\chi}$, $\lambda = \frac{g+1}{2} x_i = \frac{g+1}{2} \gamma$, $\lambda = \frac{(\chi, \chi)}{(x_i, x_i)} \sum_{i=1}^{J} \frac{g+1}{2} \gamma$ and hence $(x, x_i) = (\chi, \chi) = (\chi, \chi)$

We are now ready to prove the rational isomorphism theorem. This theorem states roughly that \mathcal{L} is determined up to isomorphism by \mathcal{L}_o , $\overline{\Pi}$, and the action of \mathcal{L}_o on $\mathcal{L}_{\overline{\eta}}$, where $\delta_{\overline{\Pi}}$ is a distinguished element of $\overline{\Pi}$. depending only on $\overline{\Pi}$. Indeed we define $\overline{\mathcal{L}}_{\overline{\eta}}$ as follows:

- (I) If Π is of type A_1 , $\nabla_{\overline{\Pi}}$ is the unique element of $\overline{\Pi}$.
- (II) If ∏ is of type C_r (r≥2), $\sqrt[3]{\pi}$ is the long root of ∏.
- (III) If $\overline{\Pi}$ is not reduced, $\delta_{\overline{\Pi}}$ is the unique element of $\overline{\Pi}$ such that $2\delta_{\overline{\Pi}} \in \overline{\Sigma}$.
- (IV) In all other cases, we do not define $\delta_{\overline{\Pi}}$.

 It is not necessary to define $\delta_{\overline{\Pi}}$ in the cases covered by (IV) since, as we shall see, in these cases \mathcal{L} is determined up to isomorphism by \mathcal{L}_o and $\overline{\Pi}$. We note that in the cases covered by (I), (II), and (III), $\delta_{\overline{\Pi}}$ is the unique element of $\overline{\Pi}$ such that $m\delta_{\overline{\Pi}}$ is of maximum length in $\overline{\mathcal{L}}$ for some positive integer m. Conversely, if $\widetilde{\mathcal{L}}$ has this last property, then $\overline{\Pi}$ is covered by cases (I), (II), and (III) or $\overline{\Pi}$ is of type G_2 .

 We need not define $\delta_{\overline{\Pi}}$ for $\overline{\Pi}$ of type G_2 since, by Thm. 4.3, $[\mathcal{L}_o, \mathcal{L}_o]$ acts trivially on the long root space in this case. We define $\delta_{\overline{\Pi}}$ $\widetilde{\mathcal{L}}$ similarly.

In the theorem, we are interested in extending isomorphisms $\mathcal{L}_o \longrightarrow \mathcal{I}_o'$ to isomorphisms $(\mathcal{L},\mathcal{I}) \longrightarrow (\mathcal{L}',\mathcal{I}')$. We have the following necessary condition for an isomorphism $\mathcal{L}_o \longrightarrow \mathcal{L}_o'$ to have such an extension:

Prop. 1: Let $\mathcal{J}_o \xrightarrow{\varphi_o} \mathcal{J}_o'$ be an isomorphism which extends to an isomorphism $(\mathcal{L}, \mathcal{I}) \xrightarrow{\varphi_o} (\mathcal{L}', \mathcal{I}')$. Let $\emptyset \in \Pi$ such that $m \mathcal{I}$ is of maximum length in \sum for some positive integer m and let $\mathcal{I}' \in \Pi'$ such that $m' \mathcal{I}'$ is of maximum length in \prod' for some positive integer m'. Then, $\mathcal{T}_{\mathcal{I}'}^{\varphi_o} = \mathcal{T}_{\mathcal{I}'}'$.

<u>Proof:</u> It is clear that $(\chi^{\phi^*}, \chi^{\phi^*}) = (\chi', \chi')$. Thus, $\mathcal{H}_{\chi'} = \mathcal{H}_{\chi\phi^*}$. Therefore, it suffices to show that $\mathcal{H}_{\chi^{\phi^*}} = \mathcal{H}_{\chi\phi^*}$. This however is immediate since $\mathcal{H}_{\chi}^{\phi} = \mathcal{H}_{\chi\phi^*}$ for $\delta \in \overline{\Sigma}$. q.e.d.

Corollary: Suppose χ_{Π} and $\chi_{\Pi'}$ are defined. Then, $\chi_{\Pi'} \subseteq \mathcal{L}_{\chi_{\Pi'}}$, $\chi_{\Pi'} \subseteq \mathcal{L}_{\chi_{\Pi'}}$, and $\chi_{\Pi'} = \mathcal{L}_{\chi_{\Pi'}}$ for any isomorphism $\chi_{\sigma,\chi_{\Pi'}} = \mathcal{L}_{\sigma,\chi_{\Pi'}}$, which extends to an isomorphism $(\mathcal{L},\mathcal{I}) \longrightarrow (\mathcal{L}',\mathcal{I}')$.

Proof: The two inclusions follow from Prop. 4.1. q.e.d.

If \prod and \prod are both of type A_1 or C_r $(r \ge 2)$, then $\prod_{k=1}^{\infty} = (0)$ and $\prod_{k=1}^{\infty} = (0)$, and so the corollary is not of interest in these cases. However, it is of interest when \prod and \prod are not reduced.

If \mathcal{M}_i is a Lie algebra over \mathcal{R} and V_i is an \mathcal{M}_i -module for i=1,2, an equivalence of representations from (\mathcal{M}_i,V_i) onto (\mathcal{M}_a,V_a) is a pair (φ,ρ) such that $\mathcal{M}_i = \varphi \cap \mathcal{M}_a$ is a Lie algebra isomorphism, $V_i = \varphi \cap V_a$ is a linear bijection, and $(V_i,M_i)^{\rho} = V_i \cap M_i^{\varphi}$ for $V_i \in V_i$ and $M_i \in \mathcal{M}_i$.

We now state and prove the main isomorphism theorem:

Theorem 1: Let \mathcal{L} be a central simple Lie algebra over \mathcal{L} with maximal split toral subalgebra \mathcal{I} and restricted root decomposition $\mathcal{L} = \mathcal{L}_o \oplus \sum_{\chi \in \Sigma} \mathcal{L}_{\chi}$. Let $\overline{\Pi}$ be a fundamental system for Σ and define a distinguished root $\mathcal{L}_{\overline{\Pi}} \in \overline{\Pi}$ as in (10). Whenever $\mathcal{L}_{\overline{\Pi}}$ is defined, put $\mathcal{L}_{\chi} = \mathcal{L}_{\chi} =$

annihilator of \mathcal{I}_{δ} in \mathcal{I}_{o} for $\delta \in \Sigma$. Assume $[\mathcal{I}_{o}, \mathcal{I}_{o}] \neq (0)$ and, if Π is of type B_{r} $(r \geq 2)$, assume $[\mathcal{I}_{o}, \mathcal{I}_{o}]$ is not isomorphic to the skew transformations with respect to the trace form in a Cayley division algebra over \mathcal{K} . Make the same assumptions and definitions for \mathcal{I}' , \mathcal{I}' , Π' , Π' , and Π' and Π' are isomorphic, $[\mathcal{I}_{o}, \mathcal{I}_{o}]$ and $[\mathcal{I}_{o}', \mathcal{I}_{o}']$. Suppose that Π and Π' are isomorphic, $[\mathcal{I}_{o}, \mathcal{I}_{o}]$ and $[\mathcal{I}_{o}', \mathcal{I}_{o}']$ contain the same number of simple summands, and one of the following holds:

- (a) $\mathcal{Y}_{\overline{M}}$ and $\mathcal{Y}'_{\overline{M}'}$ are not defined and we have an isomorphism φ_o of one of the simple summands of $[\mathcal{L}_o, \mathcal{L}_o]$ onto one of the simple summands of $[\mathcal{L}_o', \mathcal{L}_o']$.
- (b) $\sqrt[3]{\pi}$ and $\sqrt[3]{\pi}$, are defined, $[\mathcal{J}_o, \mathcal{J}_o]$ acts trivially on $\mathcal{J}_{\sqrt[3]{\pi}}$, and we have an isomorphism \mathcal{P}_o of one of the simple summands of $[\mathcal{L}_o, \mathcal{L}_o]$ onto one of the simple summands of $[\mathcal{L}_o, \mathcal{L}_o]$.
- (c) $\mathcal{Y}_{\overline{\Pi}}$ and $\mathcal{Y}'_{\overline{\Pi}}$ are defined, $[\mathcal{L}_{o},\mathcal{L}_{o}]$ acts non-trivially on $\mathcal{L}'_{\overline{\Pi}}$, and we have an equivalence of representations (\mathcal{X}_{o},ρ) from $([\mathcal{L}_{\mathcal{X}_{\overline{\Pi}}},\mathcal{L}_{\mathcal{X}_{\overline{\Pi}}}],\mathcal{L}'_{\mathcal{X}_{\overline{\Pi}}})$ onto $([\mathcal{L}'_{\mathcal{X}_{\overline{\Pi}}},\mathcal{L}'_{\mathcal{X}_{\overline{\Pi}}}],\mathcal{L}'_{\mathcal{X}_{\overline{\Pi}}})$ such that $\mathcal{X}'_{\overline{\Pi}} = \mathcal{X}'_{\overline{\Pi}}$. In this case, put $\varphi_{o} = \mathcal{X}_{o}[\mathcal{L}_{o,\mathcal{X}_{\overline{\Pi}}}, \text{ where } \mathcal{L}_{o,\mathcal{X}_{\overline{\Pi}}} = [\mathcal{L}'_{\mathcal{X}_{\overline{\Pi}}},\mathcal{L}_{o,\mathcal{X}_{\overline{G}}}] \cap [\mathcal{L}_{o},\mathcal{L}_{o}]$. Then, there exists an isomorphism $(\mathcal{L},\mathcal{Y})$ — $(\mathcal{L}',\mathcal{Y}')$ which extends φ_{o} .

<u>Proof:</u> Choose K and \mathcal{L} as at the beginning of this chapter. We will be free to choose any \mathcal{L} , \mathcal{H}_o , \mathcal{L}' , or \mathcal{H}_o' . We may assume that $\mathcal{I} \neq (0)$.

If $\overline{\Pi}$ and $\overline{\Pi}'$ are of type A_1 or are not reduced, it follows from Thm. 4.2 and Thm. 4.4 that the actions of $[\mathcal{L}_{v}, \mathcal{L}_{o}]$ on $\mathcal{L}_{\delta_{\overline{\Pi}}}$ and $[\mathcal{L}', \mathcal{L}'_{o}]$ on $\mathcal{L}'_{\delta_{\overline{\Pi}}}$ are non-trivial and hence neither (a) nor (b) holds. But $\overline{\Pi}$ is not of type D or E, by Prop. 3.4. Thus, (a) or (b) holds if and only if one of the following holds:

- (d) $\overline{\prod}$ and $\overline{\prod}'$ are of type A_n $(r \ge 2)$.
- (e) We may label the roots of Π as follows: δ_i δ_i δ_s δ_s δ_{s+1} δ_{r-1} , where $1 \le s < r$, p=2 or 3, and, if δ_i δ_i' is the isomorphism of Π onto Π' , the actions of $[\mathcal{L}_{c}, \mathcal{L}_{a}]$ on $\mathcal{L}_{\delta_{s+1}}$ and $[\mathcal{L}'_{o}, \mathcal{L}'_{o}]$ on $\mathcal{L}'_{\delta'_{s+1}}$ are trivial.

Then, in these cases φ_o is an isomorphism of one of the simple summands of $[\mathcal{L}_o,\mathcal{L}_o]$ onto one of the simple summands of $[\mathcal{L}_o',\mathcal{L}_o']$.

Suppose first of all that (d) holds. Label the roots of Π as follows: $\{ v_1, v_2, \dots, v_r \}$. Let $\{ v_1, \dots, v_r \}$ be the isomorphism of Π onto Π' . Putting $T = \Pi'$ and $T' = \Pi'$, we may apply the discussion at the beginning of this chapter. We have $\mathcal{L}_{TO} = [\mathcal{L}_o, \mathcal{L}_o]$ and $\mathcal{L}_{TO}' = [\mathcal{L}_o', \mathcal{L}_o']$. Suppose $[\mathcal{L}_o, \mathcal{L}_o]$ and $[\mathcal{L}_o', \mathcal{L}_o']$ are simple. Choose $\mathcal{L}_{TO}, \mathcal{L}_o'$, and Π_o' so that $(\mathcal{L}_o \cap [\mathcal{L}_o', \mathcal{L}_o'])^{\mathcal{L}_o} = \mathcal{L}_o' \cap [\mathcal{L}_o', \mathcal{L}_o']$ and $\Pi_o^{\mathcal{L}_o'} = \Pi_o'$. Then, by lemma 2, there exists a *-isomorphism $(\Pi, \Pi_o) \longrightarrow (\Pi', \Pi_o')$ and $\Psi \in W$ such that $f \mid \Pi_o = (\Psi \mid \Pi_o) \circ \varphi_o^*$. By Thm. 1.2, we are done in this case. Suppose $[\mathcal{L}_o, \mathcal{L}_o']$ and $[\mathcal{L}_o', \mathcal{L}_o']$ are not simple. Label the simple summands of $[\mathcal{L}_o, \mathcal{L}_o']$ and $[\mathcal{L}_o', \mathcal{L}_o']$ as in (7). Choose 1,1' $\in \{1, \dots, r+1\}$ such that φ_o is an isomorphism

of $\mathcal{J}_{o,i}$ onto $\mathcal{J}_{o,i'}$. Choose \mathcal{J} , \mathcal{T}_{o} , \mathcal{J}' , and \mathcal{T}_{o}' as in lemma 1. Then, by lemma 1 (with $\mathbb{W}=1$), we obtain an isomorphism $([\mathcal{J}_{o},\mathcal{J}_{o}],\mathcal{J}_{o}[\mathcal{L}_{o},\mathcal{L}_{o}]) \xrightarrow{\psi_{o}} ([\mathcal{L}'_{o},\mathcal{L}'_{o}],\mathcal{J}'_{o}[\mathcal{L}'_{o},\mathcal{L}'_{o}])$ such that $\psi_{o}|\mathcal{J}_{o,i}=\varphi_{o}$ and, by Thm. 1.2, ψ_{o} extends to an isomorphism $(\mathcal{L},\mathfrak{I}_{o}) \xrightarrow{\psi_{o}} (\mathcal{I}',\mathfrak{I}'_{o})$.

Suppose next that (e) holds. Putting $T = \{1, \dots, 1, k\}$ and $T' = \{x'_1, \dots, x'_s\}$, we may apply the discussion at the beginning of this chapter. For any choice of $\frac{1}{3}$ and $\frac{1}{1}$, we have $\frac{1}{1}$ (by Prop. 3.5), $\Pi_{\sigma,V_{c,a}} = \phi$ (by the corollary to Prop. 2.2), $\Pi_{e,\delta_{s+1}} = \dots = \Pi_{e,\delta_r} = \phi^{\circ}$ (by Prop. 3.6), Π_T is connected (by Prop. 3.7), $\mathcal{O}_{\chi_{S}} \cup \prod_{\chi_{S+1}} \cup \ldots \cup \prod_{\chi_r} \text{ is of the form } \mathcal{O}_{\chi_r} = \mathcal{O}_{\chi_{S+1}} \cup \mathcal{O}_{\chi_r} = \mathcal{O}_{\chi_{S+1}} \cup \mathcal{$ A similar remark holds for \mathcal{L}' . Therefore, $\mathcal{L}_{TA}^{s_{s_{1}}} = [\mathcal{L}_{o}, \mathcal{L}_{o}]$ and $I_{T'O} = [I'_o, I'_o]$. Moreover, for any choice of f_o , f_o , f'_o , and f'_o , we have that any *-isomorphism $(\Pi_{\rm T},\Pi_{\rm o})$ $\xrightarrow{\rm f}$ $(\Pi_{\rm T}',\Pi_{\rm o})$ such that $\mathcal{D}_{g_{\epsilon}}^{f} = \mathcal{D}_{g_{\epsilon}'}$ extends to a *-isomorphism $(\Pi, \Pi_{o}) \longrightarrow (\Pi', \Pi'_{o})$. Thus, by Thm. 1.2, it suffices to choose f_0 , f_0 , f_0 , and f_0 with the following property: There exists an isomorphism $([\mathcal{L}_{o},\mathcal{L}_{o}],f_{\Lambda}[\mathcal{L}_{o},\mathcal{L}_{o}]) \longrightarrow ([\mathcal{L}_{o}',\mathcal{L}_{o}'],f_{\Lambda}' \cap [\mathcal{L}_{o}',\mathcal{L}_{o}']), a *-isomorphism$ $(\Pi_m, \Pi_a) \xrightarrow{f} (\Pi'_m, \Pi'_a)$, and $\overline{w}_i \in \overline{W}$ such that Ψ_a extends φ_a , $\prod_{i=1}^{n} \psi_{o}^{*} = \prod_{i=1}^{n} \psi_{o}^{*} = (\overline{\psi}_{i} | \Pi_{o}) \circ \psi_{o}^{*}$. We consider the cases p=2 and p=3 separately.

Suppose $\underline{p}=2$. We first make a calculation which holds for all $\int_{\mathcal{S}} \operatorname{and} \prod_{\sigma} \operatorname{Now}, \quad \begin{cases} \chi_{s}, \chi_{s+1} \\ \chi_{s}, \chi_{s+1} \end{cases} \stackrel{(\overline{W}_{X_{s}}, \overline{W}_{S_{s+1}})^{2}}{=} \quad \begin{cases} -\chi_{s}, -\chi_{s+1} \\ \chi_{s}, \chi_{s+1} \end{cases} \text{ and } \prod_{\sigma, \chi_{s}} \prod_{\sigma, \chi_{s}}$

elements of $\Pi_{e_1X_s}$ (since $\Pi_{e_1X_{s+1}} = \phi$) and hence $\Pi_{e_1U} = \Pi_{e_1X_s} = \Pi_{e_1X_s} = \Pi_{e_1X_s}$. But $V_s(\overline{W}_{S_s}, \overline{W}_{S_{s+1}})^2 = -V_s$ and hence, by lemma 2.7, $i_{\overline{W}_{S_s}} \cup \overline{W}_{S_{s+1}}$ \mathcal{D}_{ξ_s} . Thus, $i_{\mathcal{H}_{\xi_s} \cup \mathcal{H}_{\xi_{s+1}}}$ stabilizes \mathcal{H}_{ξ_s} . But $i_{\mathcal{H}_{\xi_s} \cup \mathcal{H}_{\xi_{s+1}}}$ with any automorphism of $\Pi_{\delta_s} \cup \Pi_{\delta_{s+1}}$ and hence with the *-action. $i_{\Pi_{\alpha, \beta_s}}$ extends to a *-automorphism of Π_s . But $\overline{W}_{\delta_s} | \prod_{o_i \delta_s} = (i_{\prod_{o_i \delta_s}} | \prod_{o_i \delta_s}) \circ i_{\prod_{o_i \delta_s}}$. Thus, $\overline{W}_{\delta_s} | \prod_{o_i \delta_s}$ extends to a *-automorphism of \mathcal{T}_{δ_i} . A similar result holds for \mathcal{L}' . Suppose now that $[\mathcal{I}_o, \mathcal{I}_o]$ and $[\mathcal{I}_o', \mathcal{I}_o']$ are simple. Choose $\mathcal{L}_o, \mathcal{I}_o, \mathcal{L}_o'$, and Π'_{o} so that $(f_{o} \cap [f_{o}, f_{o}])^{\varphi_{o}} = f' \cap [f_{o}, f_{o}]$ and $\Pi'_{o} = \Pi'_{o}$. Then, \prod_{o} and \prod_{o} are *-connected and hence (by Prop. 3.5) s=1 or 2. If s=2, we are done by lemma 2. Suppose $\underline{s=1}$. If Π , and Π_0 are *-connected of *-type D_{4T} , we are done by lemma 5 (applied to $g_e = q_e^*$, $X = Y_i$, and $Y' = Y_i'$). On the other hand, if \mathcal{T}_o and \mathcal{T}_o' are not *-connected of *-type D_{i+1} , we are done by lemma 6 (applied to $X = X_i$ and X' = X'). Suppose then that $[\mathcal{L}_o, \mathcal{L}_o]$ and $[\mathcal{L}'_o, \mathcal{L}'_o]$ are not simple. Label the simple summands of $[\mathcal{L}_o,\mathcal{L}_o]$ and $[\mathcal{L}_o',\mathcal{L}_o']$ as in (7). Choose i, i' $\in \{1, \dots, s+1\}$ such that φ_o is an isomorphism of $\mathcal{L}_{q,i}$ onto $\mathcal{L}_{q,i}$. Choose f_{i} , f_{i} , and f_{i} as in lemma 1. Applying this lemma (with W=1), we are done provided \mathcal{P}^* is extendable (since we need $\mathcal{D}_{\zeta_s}^f = \mathcal{D}_{\zeta_s'}$). But $i_{\overline{\Pi_0}, \overline{s}_s}$ extends to a *-automorphism of $\overline{\Pi_{\delta_s}}$ and hence, since $(\overline{\Pi_T}, \overline{\Pi_o})$ if of the form (8), the *-components of $\Pi_{\sigma_{\epsilon}}$ are all of *-type A₁ and q_o^* is extendable.

Suppose $\underline{p=3}$. Then, $\underline{s=1}$ and $\underline{r=2}$. Suppose $[\mathcal{L}, \mathcal{L}_o]$ and $[\mathcal{L}'_o, \mathcal{L}'_o]$ are simple. Choose f, Π_o , f, and Π_o so that $(f \cap [\mathcal{L}_o, \mathcal{L}_o])^{\varphi_o} = f' \cap [\mathcal{L}'_o, \mathcal{L}'_o]$ and $\Pi_o^{\varphi_o^*} = \Pi'_o$. Then,

Suppose next that (c) holds. Then, we have one of the following:

- (f) \prod and \prod' have rank 1.
- (g) $\overline{\Pi}$ and $\overline{\Pi}'$ are of type C_r $(r \ge 2)$, $[\mathcal{L}_o, \mathcal{L}_o]$ acts non-trivially on $\mathcal{L}'_{\delta_{\overline{\Pi}'}}$.
- (h) \prod and \prod are not reduced and have rank > 1.

In each of these cases, we have an isomorphism $[\mathcal{Z}_{\delta_{\overline{\Pi}}}, \mathcal{L}_{\delta_{\overline{\Pi}}}] \xrightarrow{\chi_o} [\mathcal{L}'_{\delta'_{\overline{\Pi}}}, \mathcal{L}'_{\lambda'_{\overline{\Pi}}}]$ and a linear bijection $\mathcal{Z}_{\delta_{\overline{\Pi}}} \xrightarrow{f} \mathcal{L}'_{\delta'_{\overline{\Pi}}}$, such that $\mathcal{T}_{\delta_{\overline{\Pi}}} = \mathcal{T}'_{\delta'_{\overline{\Pi}}}$ and $[X,X_o]^f = [X^f,X_o^{\chi_o}]$ for $X \in \mathcal{L}_{\delta_{\overline{\Pi}}}$ and $X_o \in [\mathcal{L}_{\delta_{\overline{\Pi}}}, \mathcal{L}_{-\delta_{\overline{\Pi}}}]$. Put $\mathcal{Q}_o = \mathcal{X}_o / \mathcal{L}_{\delta_{\overline{\Omega}}}$.

Suppose then that (f) holds. Then, $\Pi = \int_{\Pi}^{\pi} \int_{$

Suppose next that (g) holds. Label the roots of $\overline{\mathcal{I}}$ as follows: Suppose that $\lambda_i \longrightarrow \lambda_i'$ is the isomorphism of onto $\overline{\Pi}'$. Then, $\delta_{\overline{\Pi}} = \delta_r$ and $\delta_{\overline{\Pi}'} = \delta_r'$. Put $T = \{\delta_1, \dots, \delta_{r-1}\}$ and $T' = \{ \beta'_1, \ldots, \beta'_{r-1}, \emptyset \}$. We may apply the discussion at the beginning of this chapter. For any choice of $\frac{1}{2}$ and $\frac{1}{10}$, we have $\frac{1}{10} = \frac{1}{10}$ (by Prop. 3.5), $\Pi_{e,\delta_r} \neq \Phi$ (by the corollary to Prop. 2.2), (Π_T, Π_e) is of the form (4) (by Prop. 3.6), Π_{K_r} is connected (by the corollary to Prop. 2.4), and \prod_{e,δ_r} is one of the two *-components of $\prod_{e,\delta_{r-1}}$ (by Prop. 3.6). Then, $\mathcal{L}_{TO} = [\mathcal{L}_{c}, \mathcal{L}_{c}]$ is not simple and we may label the simple summands $\mathcal{I}_{o,1},\ldots,\mathcal{I}_{o,r}$ of $[\mathcal{I}_{o,r},\mathcal{I}_{o,r}]$ as in (7) and so that $\mathcal{L}_{q,r} = \mathcal{L}_{q,g}$. Similarly, $\mathcal{L}_{q'o} = [\mathcal{L}'_o, \mathcal{L}'_o]$ is not simple and we may label the simple summands J_{o_1},\ldots,J_{o_r} of $[J_o',J_o']$ as in (7) and so that $J_{q,q'} = J_{q,r}$. Then, q_0 is an isomorphism of $J_{q,r}$ onto $J_{q,r}$. Choose f, Π_o , f', and Π_o' as in lemma 1. If g^* is extendable, we have (by lemma 1 with $\overline{w} = 1$) an isomorphism ([L, L], fn[L, L]) - ([L, L], fn[L, L]) and a *-isomorphism $(\Pi_{\Pi}, \Pi_{0}) \xrightarrow{f} (\Pi'_{\Pi'}, \Pi'_{0})$ such that Ψ_{0} extends φ_{0} , $\Pi_o^{\Psi_o^*} = \Pi_o^{\prime}$, $\text{fi} \Pi_o = \Psi_o^*$, and $\mathcal{O}_{\aleph_i}^{f} = \mathcal{O}_{\aleph_i^{\prime}}$, $j=1,\ldots,r-1$. But, by lemma 3, there exists a *-isomorphism $(\Pi_{\chi_{c}}, \Pi_{c, \chi_{c}}) \xrightarrow{g} (\Pi'_{\chi'_{c}}, \Pi'_{c, \chi'_{c}})$ such that $g|\Pi_{o,Y_r} = \varphi_o^*$. Hence, putting $h|\Pi_{Y_r} = g$ and $h|\Pi_{T_r} = f$, we have a *-isomorphism $(\Pi, \Pi_o) \xrightarrow{h} (\Pi', \Pi'_o)$ such that $h \mid \Pi_o = \Psi_o^*$. Thus, by Thm. 1.2, we are done if q_0^* is extendable. Suppose q_0^* is not extendable. We may isolate $\Pi_{o,r}$ from (8) and define *-orbits C_{L} and C_R of $\Pi_{o,r}$ as follows:

Similarly, define *-orbits C_L' and C_R' of $\Pi_{o,r}$. Then, $C_L^{\phi,*} = C_R'$ and $C_R^{\phi,*} = C_L'$. By lemma 4, \mathcal{D}_{δ_r} is a singleton $\{\alpha_r'\}$, $\mathcal{D}_{\delta_r'}$ and $\mathcal{D}_{\delta_r'} = \alpha_r' + \sum_{\beta \in \Pi_{o,\lambda_r'}} q_{\beta}'$, $\beta_r' \in \Pi_{o,\lambda_r'}$

where the q_{β} and $q_{\beta'}'$ are rational. Let $\beta \in C_L$. Choose $a_{r-1} \in \mathcal{O}_{\delta_{r-1}}$ such that $(\beta, a_{r-1}) < 0$. Then, by lemma 9,

 $q_{g} = -2\frac{(\lambda_{r,s} \alpha'_{r-1})}{(\alpha_{r,s} \alpha'_{r-1})} = -2\frac{(\lambda_{r,s} \lambda_{r-1})}{(\alpha_{r,s} \alpha'_{r-1})} = 2\frac{(\lambda_{r-1,s} \lambda_{r-1})}{(\alpha_{r,s} \alpha'_{r-1})} = \frac{2}{f(g+1)},$ where $\prod_{a,r}$ contains f components of type A_g . Thus, $q_g = \frac{2}{f(g+1)}$ for $\beta \in C_L$. Similarly, $q'_{\beta'} = \frac{2}{f(\alpha+1)}$ for $\beta' \in C'_L$. Now, by lemma 3, there exists a *-isomorphism $(\Pi_{\delta_r}, \Pi_{o,\delta_r}) = g(\Pi_{\chi'}, \Pi_{o,\chi'})$ such that $g \mid \prod_{o, v_i} = \varphi_o^*$. Then, $C_L^{i g^{-i}} = C_L^{i \varphi_o^{*-i}} = C_R$. But $q_{g^i} g^{-i} = q_{g^i}'$ for $\beta' \in C'_L$ (since $\gamma'_r = \gamma_r$) and hence $q_{\beta} = \frac{2}{f(g+1)}$ for $\beta \in C_R$. Therefore, $q_{\beta} = \frac{2}{f(g+1)}$ for $\beta \in C_L \cup C_R$. Write $M_{\pi_{\beta}} = \omega_r + \sum_{\beta \in \Pi_r} m_{\beta} \beta$, where the m_B are positive integers. By lemma 4, $q_B + q_B w_{s_L} = m_B$ for $\beta \in C_L \cup C_R$. But $(C_L \cup C_R)^{\overline{W}} = C_L \cup C_R$. Thus, $m_\beta = \frac{4}{f(\alpha+1)}$ for $\beta \in C_L \cup C_R$. But, since φ_o^* is not extendable, g > 1. Therefore, f=1, g=3, and $m_g = 1$ for $\beta \in C_L \cup C_R$. Therefore, \mathcal{T}_{c,δ_r} is connected of type A_3 . If $\beta \in C_L \cup C_R$, we have $(\beta, \alpha_r) = 0$, since otherwise $(\beta, \widehat{\alpha_r}) = -1$ and hence $(\mathcal{M}_{\overline{\Pi_{S_r}}}, \widehat{\alpha_r}) = 2 - m_{\beta} = 1$, contradicting lemma 4. Thus, \prec_r is connected to the middle root of Π_{e,δ_r} . Therefore, $(\Pi_{\delta_{i}},\Pi_{c,\delta_{i}})$ and $(\Pi_{\delta_{i}'},\Pi_{c,\delta_{i}'})$ are of the form and $\overline{w}_{\delta_{i}}$ and $\overline{w}_{\delta_{i}}$ is the map $(\mathbf{W}_{\mathbf{x}_r}|\mathbf{\Pi}_{o,\mathbf{x}_r}) \circ q^*$ is extendable. By lemma 1 (with $\overline{W} = \overline{W}_{y_r}$), there exists an isomorphism

 $([\mathcal{L}_{o},\mathcal{L}_{o}],\int_{f}\cap[\mathcal{L}_{o},\mathcal{L}_{o}]) = \psi_{o}([\mathcal{L}'_{o},\mathcal{L}'_{o}],\int_{f}\cap[\mathcal{L}'_{o},\mathcal{L}'_{o}]), \text{ a *-isomorphism}$ $([\mathcal{T}_{T},\mathcal{T}_{o}]) = \psi_{o}([\mathcal{T}'_{T},\mathcal{T}'_{o}]), \text{ and } \overline{\mathbf{w}}_{i} \in \overline{\mathbf{w}}_{i} \text{ such that } \psi_{o} \text{ extends } \varphi_{o},$ $[\mathcal{T}_{T},\mathcal{T}_{o}] = \psi_{o}([\mathcal{T}'_{i},\mathcal{T}'_{o}]), \text{ and } \overline{\mathbf{w}}_{i} \in \overline{\mathbf{w}}_{o}([\mathcal{T}'_{o},\mathcal{T}'_{o}]), \text{ a *-isomorphism}$ $[\mathcal{T}_{T},\mathcal{T}_{o}] = \psi_{o}([\mathcal{T}'_{i},\mathcal{T}'_{o}]), \text{ and } \overline{\mathbf{w}}_{i} \in \overline{\mathbf{w}}_{o}([\mathcal{T}'_{o},\mathcal{T}'_{o}]), \text{ a *-isomorphism}$ $[\mathcal{T}_{T},\mathcal{T}_{o}] = \psi_{o}([\mathcal{T}'_{o},\mathcal{T}'_{o}]), \text{ and } \overline{\mathbf{w}}_{o}([\mathcal{T}'_{o},\mathcal{T}'_{o}]), \text{ and } \overline{\mathbf{w}}_{o}([\mathcal{$

It remains to consider the case when (h) holds i.e. when \prod and \prod' are not reduced and have rank r>1. Label the roots of \prod as follows: $\{ \frac{1}{\delta_1}, \frac{1}{\delta_2}, \frac{1}{\delta_2}, \frac{1}{\delta_2} \}_{\delta_r}$. Suppose that $\{ \frac{1}{\delta_1}, \frac{1}{\delta_2}, \frac{1}{\delta_1} \}_{\delta_r}$ is the isomorphism of \prod onto \prod' . Then, $\{ \frac{1}{\delta_1}, \frac{1}{\delta_1}, \frac{1}{\delta_1}, \frac{1}{\delta_1}, \frac{1}{\delta_1} \}_{\delta_r}$ and $\{ \frac{1}{\delta_1}, \frac{1}{\delta_1},$

- (i) r=2, $M_0 \neq (0)$ and $[L_0, L_0] = L_{0, X_0}$.
- (j) $[\mathcal{L}_o, \mathcal{L}_o]$ is the direct sum of \mathcal{H}_{δ_r} , \mathcal{H}_o , and r-1 ideals of $[\mathcal{L}_o, \mathcal{L}_o]$ isomorphic to \mathcal{H}_o .

We have a similar statement for \mathcal{L}' and it is clear that (i) holds for \mathcal{L} if and only if it holds for \mathcal{L}' .

Suppose then that (i) holds for \mathcal{I} and \mathcal{I}' . Choose f, f, and f such that $(f_0 \cap [\mathcal{I}_0, \mathcal{I}_0])^{\varphi_0} = f' \cap [\mathcal{I}_0', \mathcal{I}_0']$ and f are connected and, by Prop. 3.9, f and f and f and f and f are connected and, f and f are exists a *-isomorphism (f and f and f and f and f are connected and f are connected and f are connected and f and f are connected and f are connected and f are connected and f and f are connected and f and f are connected and f are

But, since $\mathcal{M}_{o}^{\varphi_{o}} = \mathcal{M}_{o}'$, $\mathcal{M}_{a,x}^{g} = \mathcal{M}_{o,x'}'$. Thus, to complete this case, it suffices to show that $g |_{\mathcal{T}_{b, \delta}}$ extends to a *-isomorphism $\mathcal{T}_{b, --} \rightarrow \mathcal{T}_{\delta'_{b}}$ (since then g extends to a *-isomorphism $(\Pi, \Pi_c) \longrightarrow (\Pi', \Pi'_c)$ and we are done by Thm. 1.2). But Π_{δ_i} and $\Pi_{\delta_i'}$ are connected (by Prop. 3.10) and $[\mathcal{J}_o,\mathcal{J}_o]$ does not contain a simple summand which is isomorphic to the skew transformations with respect to the trace form in a Cayley division algebra over k and the same holds for $[\mathcal{J}'_o,\mathcal{J}'_o]$ (by lemma 7). Thus, by lemma 5 and 6, we can accomplish the required extension provided that $\overline{w}_{\delta_i} | \mathcal{T}_{\sigma_i \delta_i}$ extends to a *-automorphism of \mathcal{T}_{δ_i} (and \mathcal{I}' has the analogous property). But $\overline{\Pi}^{(\overline{W}_{Y_1},\overline{W}_{Y_2})^2} = -\overline{\Pi}$ and hence, by lemma 2.7, $i_{\Pi} \mid \Pi_{o} = ((\overline{W}_{\delta_{1}} \overline{W}_{\delta_{2}})^{2} \mid \Pi_{o}) \circ i_{\Pi_{o}}$. But $\Pi_{o, 2\delta} = \phi$ and hence $\overline{W}_{\delta_2} = \overline{W}_{a\delta_2}$ fixes the elements of $\overline{\Pi}_o$. Hence, $i_{\overline{H}} | \overline{\Pi}_o = i_{\overline{\Pi}_o}$. Thus, i_{Π} stabilizes Π_{o,δ_i} and $i_{\Pi} | \Pi_{o,\delta_i} = i_{\Pi_{o,\delta_i}}$. But $\mathcal{O}_{\delta_i}^{i_{\Pi}} = \mathcal{O}_{\delta_i}^{i_{\Pi}} = \mathcal{O}_{\delta_i}$ and hence i_{π} stabilizes Π_{ξ_i} . Therefore, $i_{\pi_{e,\xi_i}}$ extends to a *-automorphism of Π_{δ_i} . But $W_{\delta_i} \mid \Pi_{\delta_i} = (i_{\Pi_{\delta_i}} \mid \Pi_{\delta_i,\delta_i}) \circ i_{\Pi_{\delta_i,\delta_i}}$. Therefore, $W_{\delta_i} \mid \Pi_{\delta_i,\delta_i}$ extends to a *-automorphism of $\Pi_{\mathbf{z}}$.

Suppose now that (j) holds for \mathcal{L} and \mathcal{L}' . Put $T = \{\delta_1, \dots, \delta_{r-1}\}$ and $T' = \{\delta_1', \dots, \delta_{r-1}'\}$. Then, for any $\{\xi_1, \dots, \xi_r'\}$, and $\{\Pi'_{\sigma_1}, \Pi'_{\sigma_2}\}$ and $\{\Pi'_{\sigma_1}, \Pi'_{\sigma_2}\}$ are of the form (4) (by Prop. 3.8) and $\{\Pi'_{\delta_r}\}$ and $\{\Pi'_{\delta_r}\}$ are connected (by the corollary to Prop. 2.2). Suppose that $\{M'_{\sigma_r}\} = \{0\}$ and $\{M'_{\sigma_r}\} = \{0\}$. Then, $\{M'_{\sigma_r}\} = \{0\}$ and $\{M'_{\sigma_r}\} = \{0\}$ and $\{M'_{\sigma_r}\} = \{0\}$ so that $\{M'_{\sigma_r}\} = \{M'_{\sigma_r}\} = \{M'_{\sigma_r}\}$

suffices to show that g extends to a *-isomorphism $(\Pi, \Pi_o) \longrightarrow (\Pi', \Pi'_o)$. But by Prop. 3.8, $\Pi_{To} = \phi$ and $\Pi'_{T'O} = \phi$. Hence, Π_{T} and $\Pi'_{T'}$ are of the form . Thus, it suffices to show that $\mathcal{T}_{\delta} \cup \mathcal{T}_{\delta}$ is of the form (1) (and an analogous result for \mathcal{L}'). But since $\Pi_{s_{-}} = \phi$, every element of $\mathcal{O}_{s_{r_{-}}}$ is connected to an element of $\mathcal{D}_{\mathbf{x}_r}$ and every element of $\mathcal{D}_{\mathbf{x}_r}$ is connected to an element of $\mathcal{D}_{\mathbf{x}_r}$. No element of $\mathcal{O}_{\delta_{r-1}}$ is connected to two elements of \mathcal{O}_{δ_r} (since otherwise any element of \prod_{σ} connected to one of those two elements of $\nabla_{\delta_{\Gamma}}$ would be an element of $\Pi_{\bullet, \gamma_{r_{-1}+2}\gamma_{r}}$) and no element of $\mathcal{D}_{\gamma_{r_{-1}+2}\gamma_{r}}$ is connected to two elements of $\overline{\mathcal{O}}_{\gamma_{r-1}}$ (since $2\gamma_{r-1} + \gamma_r \notin \Sigma$). Therefore, it remains to show that if $\phi_{r-1} \in \mathcal{O}_{\delta_{r-1}}$ and $\phi_r \in \mathcal{O}_{\delta_r}$ are connected then $(\phi_{r-1}, \widehat{\phi_r}) = -1$ and $(\alpha_r, \alpha_{r-1}) = -1$. The first equation holds since otherwise any element of To connected to of would be an element of To, or take and the second equation holds since $2\eta_{r-1} + \delta_r \notin \sum$. Suppose finally that $M_{r-1} \neq 0$ and $\mathcal{M}'_{\bullet} \neq (0)$. Then, $\mathcal{L}_{\mathcal{M}}$ and $\mathcal{L}'_{\mathcal{M}}$ are non-zero and non-simple. Label the simple summands $\mathcal{I}_{0,r},\ldots,\mathcal{I}_{0,r}$ of \mathcal{I}_{TO} as in (7) and so that $\mathcal{I}_{0,r}=\mathcal{M}_{0}$. Label the simple summands $\mathcal{J}_{o,1},\ldots,\mathcal{J}_{o,r}$ of $\mathcal{J}_{T'O}$ as in (7) and so that $J_{o,r} = \mathcal{M}'_{o}$. We apply lemma 1 to $J_{o,r} = \mathcal{J}_{o,r} = \mathcal{J}_{o,r}$. It is clear from the proof of lemma 1 that the choice of f, f, and f can be made so that the conclusion of the lemma holds and so that $(f_0 \cap \mathcal{T}_{\zeta_r})^{\varphi_0} = f_0 \cap \mathcal{T}_{\chi_1}$ and $\prod_{a,n} q_a^{a} = \prod_{a,n}' q_{a}'$, where for the moment $\prod_{a,n} q_a$ denotes the union of the *-components corresponding to simple summands of $\mathcal{\Pi}_{\delta_{-}}$ and $\prod_{o_i n_{s_i'}}'$ is defined similarly. Then, since $\prod_{o_i n_{s_i'}} = (\prod_{o_i n_{s_i'}} \cap \prod_{o_i n_{s_i'}}) \cup \prod_{o_i n_{s_i'}} \cup \prod_{o_i n_{s_$ and $\Pi_{o,v_r'} = (\Pi_{o,v_{r'}} \cap \Pi_{o,v_{r'}} \cap \Pi_{o,v_{r'}}) \cup \Pi_{o,n_{v'}}$, we have $(f_{o,v_{r'}} \cap f_{o,v_{r'}})^{\varphi_o} = f_{o,v_{r'}} \cap f_{o,v_{r'}}$ and $\Pi_{0,x_{c}}^{p,*} = \Pi_{0,x_{c}'}^{p,*}$. Now, $\Pi_{0,x_{c}} = \Pi_{0,x_{c}} \cap \Pi_{0,x_{c}}$, $\Pi_{0,x_{c}'} = \Pi_{0,x_{c}'} \cap \Pi_{0,x_{c}'}$

and the right hand side of these inclusions is *-connected. But, since $\mathcal{M}_{o}^{\varphi_{o}} = \mathcal{M}_{o}^{*}, (\mathcal{M}_{o}^{*}, \mathcal{M}_{o}^{*}, \mathcal{M}_{o}^{*})^{\varphi_{o}^{*}} = \mathcal{M}_{o}^{*}, \mathcal{M}_{o}^{*}, \mathcal{M}_{o}^{*}$ Hence, either $\mathcal{M}_{o}^{\varphi_{o}^{*}} \subseteq \mathcal{M}_{o}^{\varphi_{o}^{*}}$ or $\prod_{\alpha \in X'} \in \prod_{\alpha \in X'}^{q_{\alpha}^{*}}$. Therefore, by lemma 3, there exists a *-isomorphism $(\prod_{\delta_r}, \prod_{\delta_r}) \xrightarrow{g} (\prod_{\delta_r'}, \prod_{\delta_i \delta_r'})$ such that $g \mid \prod_{\delta_i \delta_r} = \varphi_o^*$. Define the right *-orbit C_R of $\Pi_{o,r}$ and the right *-orbit C_R' of $\Pi_{o,r}'$ as previously. Now, since $\Pi_{o,r} \subseteq \Pi_{o,\delta_r}$, the set C of elements of $\Pi_{o,r}$ which are connected to elements of $\mathcal{O}_{\delta_{r}}$ is a *-orbit of $\prod_{\sigma_{r}}$. Similarly , the set C' of elements of $\Pi_{\mathfrak{d},r}$ which are connected to elements of $\mathcal{D}_{\mathfrak{d}_r}$ is a *-orbit of $\Pi_{o,r}$. But if $C \neq C_R$, it is easy to see that $2 \chi_{r,r} + \chi_r \in \sum_{r}$, a contradiction. Thus, $C = C_R$. Similarly, $C' = C_R'$. But, since $(\prod_{X_c},\prod_{\sigma,X_c})$ $\xrightarrow{g} (\prod_{X_c'},\prod_{\sigma,X_c'})$ is a *-isomorphism such that $\mathcal{D}_{g,g} = \mathcal{D}_{g'}$ and $\mathcal{T}_{g,g} = \mathcal{T}_{g'}$, we have $C^g = C'$. Therefore, $C_{p} q^{*} = C_{p}^{g} = C^{g} = C' = C_{p}'$. Therefore, Q_{o}^{*} is extendable. by lemma 1 (with $\overline{W} = 1$), f_0 , f_0 , and f_0 have the following property: There exists an isomorphism $(\mathcal{L}_{T0}, \mathcal{L}_{0}, \mathcal{L}_{T0})$ $\mathcal{L}_{T'0}, \mathcal{L}_{T'0}'$ and a *-isomorphism $(\Pi_{T'}, \Pi_{T'}) \xrightarrow{f} (\Pi'_{T'}, \Pi'_{T'})$ such that $\psi_{o}|_{\mathcal{J}_{o,r}} = \varphi_{o}|_{\mathcal{J}_{o,r}}$, $\Pi_{TO}^{\psi_{o}*} = \Pi_{T'o}^{\prime}$, $f|_{TO} = \psi_{o}^{*}$, and $\mathcal{D}_{g}^{f} = \mathcal{D}_{g}$, for j=1,...,r-1. Define $(\Pi, \Pi_o) \xrightarrow{h} (\Pi', \Pi'_o)$ by $h \mid \Pi_T = f$ and $\text{n}[\Pi_{\delta} = \text{g. Define}([\mathcal{J}_{o}, \mathcal{J}_{o}], \mathcal{L}_{o}[\mathcal{J}_{o}, \mathcal{J}_{o}]) \xrightarrow{\theta_{\bullet}} ([\mathcal{J}_{o}', \mathcal{L}_{o}'], \mathcal{L}_{o}', \mathcal{L}_{o}'])$ by $\theta_0 | \mathcal{L}_{TO} = \psi_0$ and $\theta_0 | \mathcal{L}_{0, Y_0} = \varphi_0$. Then, h is a *-isomorphism such that $h \mid \prod_{o} = \theta_{o}^{*}$. By Thm. 1.2, we are done. q.e.d.
